METIS-II WIRELESS M-BUS

AMB8626-M / 2607021183000

VERSION 3.9

JANUARY 16, 2026

WÜRTH ELEKTRONIK MORE THAN YOU EXPECT

MUST READ

Check for firmware updates

Before using the product, make sure you use the most recent firmware version, data sheet, and user manual. This is especially important for Wireless Connectivity products that were not purchased directly from Würth Elektronik eiSos. A firmware update on these respective products may be required.

We strongly recommend including the possibility of a firmware update in the customer system design.

Overview of helpful application notes

Application note ANR001 - Metis-II repeater mode

<http://www.we-online.com/ANR001>

This application note describes how the single hop repeater function according to the wireless M-BUS standard EN13757 and the OMS group's specification is implemented into the firmware of the radio module Metis-II. Further details on the configuration and usage of this feature are given.

Application note ANR008 - Wireless Connectivity Software Development Kit

<http://www.we-online.com/ANR008>

To ease the integration of the Würth Elektronik eiSos radio modules into an application, Würth Elektronik eiSos offers the corresponding Software Development Kit (SDK) for most commonly used host processors. This SDK contains drivers and examples in C-code to communicate with the corresponding radio module. This application note shows which SDKs are available and describes how to download and use them.

Application note ANR010 - Range estimation

<http://www.we-online.com/ANR010>

This application note presents the two most used mathematical range estimation models, Friis and two ray ground reflection, and its implementation in the range estimation tool of the RED-EXPERT.

2 Abbreviations

Abbreviation	Name	Description
ALA	Application Layer Address	Aplication layer meter addresses in the wM-BUS frame, optional
BDM	Business Development Engineer	Support and sales contact person responsible for limited sales area
Block1	first block of EN 13757-4 frame	Is always 10 bytes long, contains L field, C field and 8 byte LLA address
CS	Checksum	XOR checksum to check the correct transmission of the previous Bytes of the UART communication protocoll
CRC16		EN 13757-4 compliant checksum (2 byte)
DC	Duty cycle	Transmission time in relation to one hour duration. 1 % means, channel is occupied for 36 s per hour by the sending device
Downlink		Transmission direction, i.e. when direction "other to meter" is intended
HIGH	Logic High signal level	Signal level equals VCC
LLA	Link Layer Address	Link layer meter addresses in the wM-BUS frame, required
L field	EN13757-4 length field	first byte of block1
LOW	Logic Low signal level	Signal levels equals 0 Volts
LPM	Low power mode	Operation mode for reduced power consumption
LSB	Least significant byte	
MSB	Most significant byte	
RF	Radio frequency	Describes everything relating to the wireless transmission
SFD	Start frame delimiter	Start byte of a frame for the command interface
SMGW	Smart meter gateway	Gateway receiving wM-BUS frames, wM-BUS role "other"
UART	Universal asynchronous receiver transmitter	The UART allows a communication of a host with the Metis-II module using a communication protocol
T & R		Tape and reel packaging with a minimum order quantity

Uplink		Transmission direction, i.e. when direction "meter to other" is intended
US	User settings	Non-volatile but changeable module configuration parameters
wM-BUS	wireless M-BUS	EN 13757 -3 and -4 standards

3 Introduction

For being able to understand this manual, using wireless M-BUS modules and USB dongles it is highly recommended to read the EN13757-3 and -4 in their most recent released version. This knowledge is required for creating and understanding wireless M-BUS compliant data, frame structures, radio configuration and communication schemes.

3.1 Operational description

The Metis-II is a radio module for wireless communication using the wM-Bus standard between devices such as meters and smart meter gateways. It complies with the requirements of EN13757 and can be used where ever radio communication in a metering background following the wireless M-BUS standard is required.

All Metis modules support the 868 MHz Band used in wM-BUS. That means S, T and C modes are supported with their corresponding sub-modes.

Wireless M-BUS is a quite complex standard which is not suitable to be used without understanding the standard itself. EN13757-3 and EN13757-4 are essential to be read and understood by users of wireless M-BUS modules in order to be able to operate these modules in the compliant way.

Starting with firmware version 2.9.0 Metis-II adds support for the use case battery operated or energy constrained data collectors. Users with this applications shall ensure that all modules use at least this firmware version.

The module performs checks on wM-BUS compliance (after EN13757-3:2013) and may discard non compliant frames without any notification towards the host.

This wireless M-BUS modules and USB dongles will enable you to read the raw radio data. This data does usually contain an encrypted payload which itself contains one or multiple coded meter reading values. Further steps are required to parse this raw data and gain human readable values out of a decrypted payload.

3.2 Block diagram

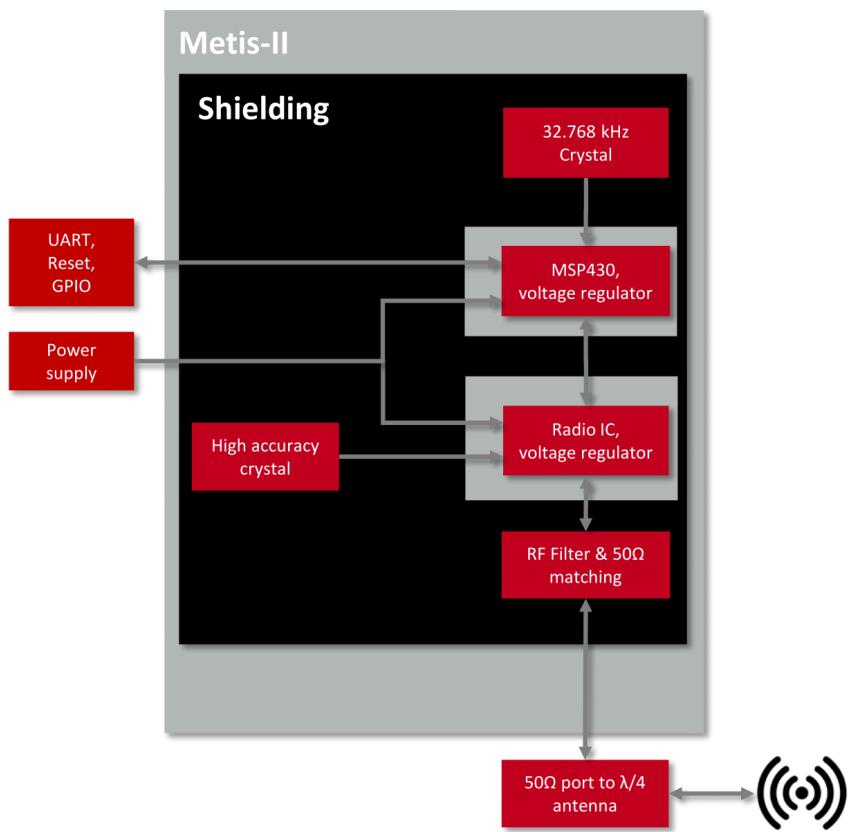

Figure 1: Block diagram of the Metis-II module

3.3 Ordering information

WE order code	Former order code	Description
2607021183000	AMB8626-M-TR	868 MHz wM-BUS module 14 dBm, T&R
2607056283001	AMB8665-M	868 MHz wM-BUS USB stick, SMA antenna connector
2607029283001	AMB8626-M-EV	EV-Kit for Metis-II module
2607021183010	n.a.	868 MHz wM-BUS module 14 dBm, T&R, Firmware 2.8.0

Table 3: Ordering information

4 Electrical specifications

As not otherwise stated measured on the EV-Board Metis-II-EV terminated unused module pads and $50\ \Omega$ conducted.

4.1 Operating conditions

Description	Min.	Typ.	Max.	Unit
Ambient temperature	-30	25	85	°C
Supply voltage (VDDS)	2.0	3.0	3.6	V

Table 4: Operating conditions, Metis-II

4.2 Absolute maximum ratings

Description	Min.	Typ.	Max.	Unit
VCC	-0.3		3.9	V
Output RF level		14		dBm
Input RF level			10	dBm

Table 5: Absolute maximum ratings, Metis-II

4.3 Power consumption

The transmit and receive currents are depending on the impedance matching, and therefore may vary depending on antenna selection and matching.

A stable power supply is indispensable to ensure valid operating conditions for the module. Releasing the */RESET* pin before the VCC is stable may damage the module permanently.

A stable power supply and proper antenna design and matching is indispensable to achieve the stated radio characteristics.

4.3.1 Static

The stated current consumption is the sum of the CPU current and the radio current, depending on the active radio mode.

Conditions: Metis-II-EV with $T = 25^\circ\text{C}$, $\text{VCC} = 3.3\text{ V}$, terminated unused module pads and $50\ \Omega$ conducted.

Description	Typ.	Unit
TX current, 14 dBm output power	53	mA
RX current	30	mA
Low power (LPM3), radio off, UART via ACLK	3	μA

Table 6: Power consumption, Metis-II

4.4 Radio characteristics

The radio characteristics of wireless M-BUS products are specified by EN13757-4:2013 and were implemented in a standard compliant way into the Metis-II firmware.

Conditions: Metis-II-EV, $T = 25^\circ\text{C}$, $\text{VCC} = 3.0\text{ V}$, terminated unused module pads, $50\ \Omega$ conducted

The stated best RX sensitivity is linked to the stated "Min" data rate.

Description	Min	Typ.	Max	Unit
Frequency band	868.3		869.525	MHz
Data rate	16.384		100	kbps
Best RX sensitivity			-106	dBm
TX power	-5	14	14	dBm

Table 7: Radio characteristics, Metis-II

4.5 Pin characteristics

Conditions: T = 25 °C, VCC = 3.0 V

Property	Min	Typ.	Max	Unit
GPIO maximum current per pin		2		mA
GPIO maximum current over all		48		mA
Internal pull-up resistor	20	35	50	kΩ
Internal Pull-down resistor	20	35	50	kΩ

Table 8: Pin characteristics, Metis-II

4.6 Integrated flash characteristics

The integrated flash memory has only a limited number cycles. This number of flash cycles has a guaranteed min. value of 10000 and a typical value of 100000.

Hosts shall implement methods to prevent their applications from excessively using flash cycles. This can be achieved by always performing a CMD_GET_REQ before any CMD_SET_REQ and other command that uses flash cycles.

5 Pinout

For the footprint information needed for the design-in please refer to chapter 22.4.

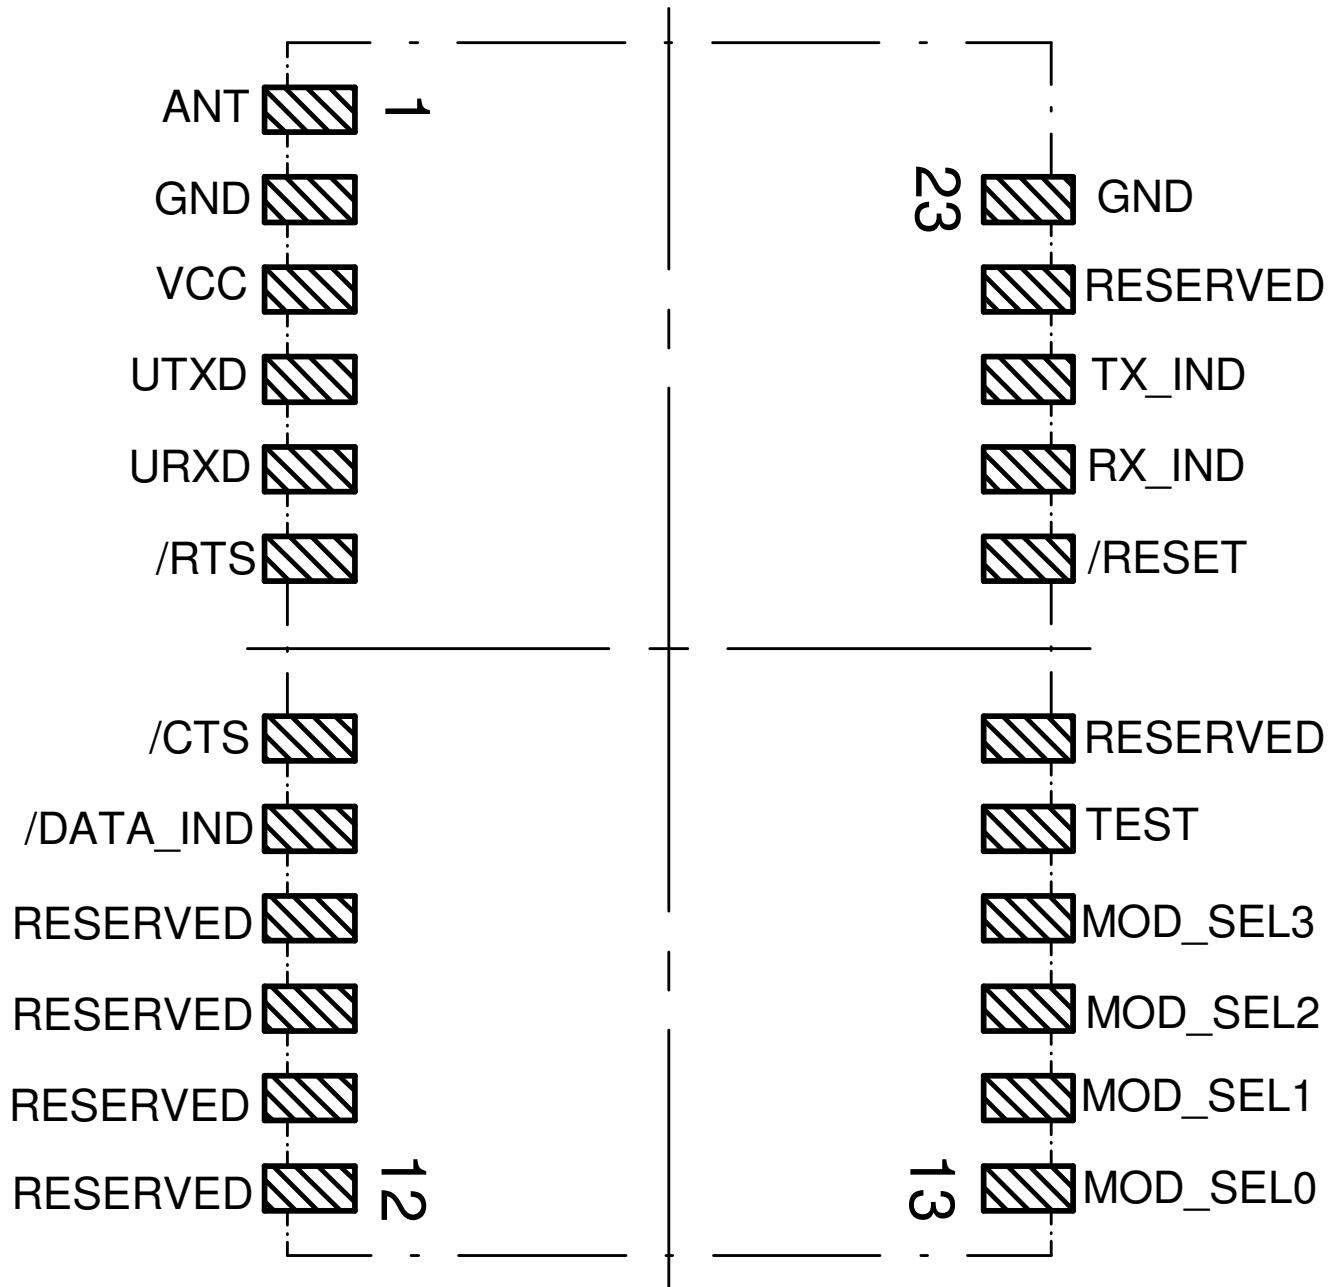

Figure 2: Pinout (top view)

No	Designation	I/O	Description
1	<i>ANT</i>		Antenna connector 50 Ω
2	<i>GND</i>	Supply	Ground
3	<i>VCC</i>	Supply	Supply voltage
4	<i>UTXD</i>	Output	UART (module transmit)
5	<i>URXD</i>	Input	UART (module receive)
6	<i>/RTS</i>	Output	Indicates that the module is busy when HIGH.
7	<i>/CTS</i>	Input	<i>/CTS</i> flow control pin. Can be enabled in user settings. Connect to <i>GND</i> disabled.
8	<i>/Data_IND</i>	Output	Data indication towards host. Do not connect if not needed.
9	Reserved	I/O	Reserved. Internal pull-down. Do not connect.
10	Reserved	I/O	Reserved. Internal pull-down. Do not connect.
11	Reserved	I/O	Reserved. Internal pull-down. Do not connect.
12	Reserved	I/O	Reserved. Internal pull-down. Do not connect.
13	<i>MOD_SEL0</i>	Input	Obsolete. Internal pull-down. Do not connect.
14	<i>MOD_SEL1</i>	Input	Obsolete. Internal pull-down. Do not connect.
15	<i>MOD_SEL2</i>	Input	Obsolete. Internal pull-down. Do not connect.
16	<i>MOD_SEL3</i>	Input	Obsolete. Internal pull-down. Do not connect.
17	TEST	Debug	Debug pin. Do not connect.
18	Reserved	I/O	Reserved. Internal pull-down. Do not connect.
19	<i>/RESET</i>	Input	See chapter 11.1.1). Uses internal pull-up. LOW level holds module in reset state.
20	<i>RX_IND</i>	Output	Indicates RF data reception signaled by HIGH.
21	<i>TX_IND</i>	Output	Indicates RF data transmission signaled by HIGH.
22	Reserved	I/O	Reserved. Internal pull-down. Do not connect.
23	<i>GND</i>	Supply	Ground

Table 9: Pinout

6 Quickstart

6.1 Minimal pin configuration

In factory state the module is immediately ready for operation. The following pins are required in the minimal configuration:

/RESET, VCC, GND, UTXD, URXD, /RTS and ANT.

If the module is to be connected to a PC a converter cable or IC (e.g. 3.3 V TTL to USB) is necessary to achieve interface compatibility. The Metis-II-EV already implements such a USB converter to be directly connected to a PC.

Not interpreting the */RTS* line of the module as described in this manual may cause undefined behavior and data loss.

6.2 Power up

Recommended procedure for starting the module into normal operation:

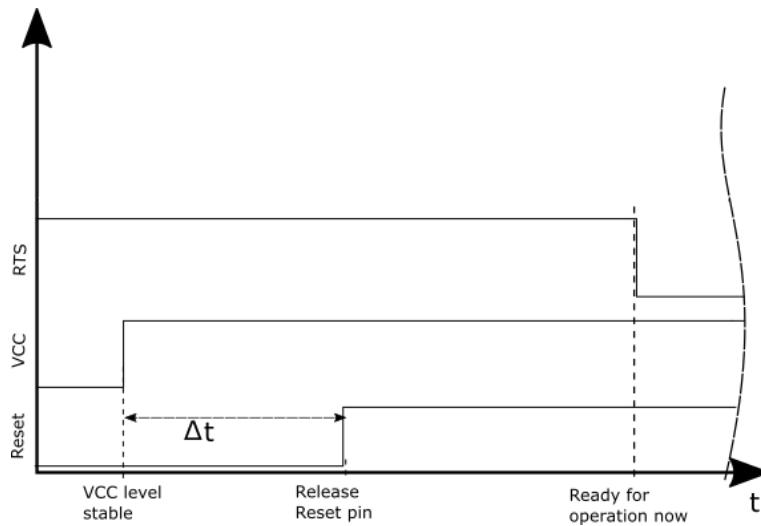

After supply voltage is applied to the module, the */RESET* pin shall be held to LOW level for another Δt of at least 1 ms after the *VCC* is stable to ensure a safe start-up.

Due to DCO calibration a startup may require a duration of up to 1000 ms.

If the module is used on a battery-powered system, using a matching reset-IC (or a discrete block for an according delay) it is highly recommended to ensure a stable module power up and ensures a safe behavior towards a battery getting empty.

Applying a reset (e.g. a host temporarily pulling the */RESET* pin down for at least 1 ms and releasing it again) after the *VCC* is stable is also sufficient.

6.3 Quickstart example

Connect the two devices (modules, EV-Boards or USB dongles) to a PC. You may need to install FTDI VCP drivers manually or by using windows update. A minimum distance of 2 meters between the two devices shall be kept at all time to avoid overmodulation of the receiver.

A terminal program, for example *hterm*, is used to perform the communication via COM ports. The two corresponding COM ports have to be selected and opened with a default configuration of 9600 Baud, 8 data bits, 1 stop bit and parity set to none (8n1).

Make sure the received data is shown also as "hex" by enabling the corresponding checkbox:

By default, the wireless M-BUS mode is S2 mode (Mode_Preset=0x03), which means that S1-m and S2 mode frames can be received and S2 mode frames can be sent.

Sending and receiving a wM-BUS frame

To send a wM-BUS frame the so called transparent mode can be used. To do so, simply enter the frame into the input line of *hterm*. The "Type" field under input control in *hterm* needs to be changed from "ASC" to "HEX" before entering the first byte.

For advanced applications we encourage the user to prefer using `CMD_DATA_REQ` to request the module sending data as this command will provide a status "frame sent" or "frame not sent" with the `CMD_DATA_CNF` confirm message.

It is mandatory that for entering hex data the "Type: HEX" is selected in the hterm input control block.

The default state of this field is "Type: ASC" indicated by a turquoise color background of the characters that are entered in the input line.

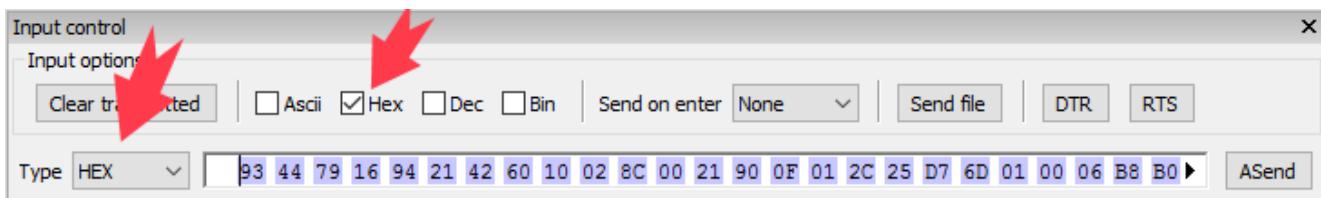

The user must make sure that the frame content is wireless M-BUS compliant. See EN13757-3 and EN13757-4 for details.

In case the frame is:

In S2-mode the uplink and downlink radio settings are the same (i.e. 868.300 MHz and 32768 bps symbol rate with manchester coding). In case another wM-BUS-mode is intended to be used, suiting wM-BUS-modes must be selected on both communication partners (see table 26).

7 Functional description

7.1 System configuration parameters

The parameters that determine the functionality of the module can be organized into two categories: The non-volatile user settings parameters (see chapter 10) that can be modified using the `CMD_SET_REQ` command and retain their values after a power reset.

On the other hand, the volatile settings (called "Runtime settings") can be accessed by explicit commands and used to quickly (but temporarily) modify specific parameters without using flash cycles. These settings are only valid until a reset is performed and shall be used when frequent updates of settings are necessary.

Please note that each `CMD_SET_REQ` will consume one flash cycle, which are limited due to the hardware.

After modifying a user settings via `CMD_SET_REQ` a restart of the module must be performed so that the new parameter values are initialized correctly.

Not performing a restart after changing any user setting may cause malfunctions of the module.

7.2 Configuring the radio

The Metis-II can be configured to use one of the following EN13757-4 wM-BUS modes. Please note that the chip rate of some modes is not equal to the data rate (bit rate) because of the coding.

Manchester will introduce a factor 1/2, resulting in: chip rate / 2 = data rate. 3 out of 6 coding will introduce a factor 2/3, resulting in: chip rate * (2 / 3) = data rate. In case of NRZ coding the factor is 1, resulting in chip rate = data rate.

wM-BUS Mode	Direction	Frequency [MHz]	Chip rate [kcps]	Coding
S1-m	TX only	868.300	32.768	Manchester
S2	RX	868.300	32.768	Manchester
S2	TX	868.300	32.768	Manchester
T1_meter	TX only	868.950	100	3 out of 6
T2_other	RX	868.950	100	3 out of 6
T2_other	TX	868.300	32.768	Manchester
C1_meter	TX only	868.950	100	NRZ
C2_other	RX	868.950	100	NRZ
C2_other	TX	869.525	50	NRZ
C2_T2_other	RX only	868.950	100	auto detect

Table 10: wM-BUS mode radio settings for 868 MHz

7.2.1 Transmission of frames

The following parameter(s) needs to be checked or adopted in case of sending frames to a meter or as a meter. This can be done by means of a `CMD_SET_REQ` or the configuration software ACC:

- `Mode_Preset`: This parameter defines the mode to be used. It is sufficient to be able to communicate to any meter or SMGW. For corresponding wM-BUS mode selection see table 26.
- Perform a reset of the module using the `/RESET` pin or by sending the command `CMD_RESET_REQ` to apply changes to user setting parameter(s).
- After updating these parameters, frames can be transmitted using the a `CMD_DATA_REQ` or the transparent mode. The minimum allowed packet length is a L field of 0x09 which represents a minimum frame containing only Block1.

7.2.2 Reception of frames

The following parameter(s) need to be checked or adopted in case of receiving frames from a meter or as a meter. For corresponding wM-BUS mode selection see table 26.

Receiving is only possible in the modes containing a "2" in their name e.g. S2, T2_other, C2_other, C2_T2_other, F2, N2a, N2f

This can be done by means of a `CMD_SET_REQ` or the configuration software ACC:

- First, you need to look up the role (meter or other) and wM-BUS mode of the device you want to receive data from. Then take the corresponding wM-BUS mode value and role from table 26 and proceed by writing it into the `Mode_Preset` parameter by using a `CMD_SET_REQ`.
- Perform a reset of the module using the `/RESET` pin or by sending the command `CMD_RESET_REQ` to apply changes to user setting parameter(s).

Please have in mind that meters are using a periodic interval to send frames, so you need to wait at least this period in order to receive a meter that is in range.

In heavy duty environments with multiple meters, it is possible that packet collisions may happen. In this case you have to spend multiple periods to receive the expected meter.

The module will perform some checks on wM-BUS compliance (EN13757-3:2013 & -4:2013) and may discard non compliant frames without notification to the host.

7.3 Recommended settings for data collectors 868 MHz

Besides setting the user setting `Mode_Preset`, we highly recommend to perform the following steps if you desire to set up a data collector or receiver device. These settings assume unidirectional communication only (in this case: Receiver function only). For bidirectional communication a custom firmware is required.

- Perform a `CMD_FACTORYRESET_REQ`: 0xFF1100EE
- Perform a `CMD_RESET_REQ`: 0xFF0500FA
- Your host UART needs to use 9600 Baud 8n1 UART (for the next couple steps)
- Set the `UART_CMD_OUT_ENABLE` = 1, using `CMD_SET_REQ`: 0xFF0903050101F0
- Set the `RSSI_Enable` = 1, using `CMD_SET_REQ`: 0xFF0903450101B0
- Set the UART baud rate to 115200 Baud, using `CMD_SETUARTSPEED_REQ`: 0xFF100107E9
- Set `Mode_Preset` to the default receive mode you want to achieve.
For S2 mode no change is required, for C2_T2_other (RX only mode) use `CMD_SET_REQ`: 0xFF0903460109BB
- Perform a `CMD_RESET_REQ`: 0xFF0500FA
- Now your host UART needs to use the configured UART baudrate (115200 Baud)
- The host shall not send `CMD_DATA_REQ` or transparent data to the module

7.4 Recommended settings for battery operated data collectors on C and T mode

Besides setting the user setting `Mode_Preset`, we highly recommend performing the following steps if you desire to set up a data collector or receiver device. These settings assume unidirectional communication only (in this case: receiver function only).

For bidirectional communication a custom firmware is required.

- Perform a `CMD_FACTORYRESET_REQ`: 0xFF1100EE
- Perform a `CMD_RESET_REQ`: 0xFF0500FA
- Your host UART needs to use 9600 Baud 8n1 UART (for the next couple steps)
- Set the `UART_CMD_OUT_ENABLE` = 1, using `CMD_SET_REQ`: 0xFF0903050101F0
- Set the `RSSI_Enable` = 1, using `CMD_SET_REQ`: 0xFF0903450101B0
- Set the UART baud rate to 115200 Baud, using `CMD_SETUARTSPEED_REQ`: 0xFF100107E9

- Set Mode_Preset to C1-meter mode.
for C1_meter use CMD_SET_REQ: 0xFF090346010CBE
- Perform a CMD_RESET_REQ: 0xFF0500FA
- Now your host UART needs to use the configured UART baudrate (115200 Baud)
- to enable the C + T (C2_T2_other) receiver mode use the CMD_SET_MODE_REQ: 0xFF040109F3
- The module will now indicate received radio frames towards the host using the CMD_DATA_IND message type.
- In this mode, the host shall never send CMD_DATA_REQ, CMD_SET_REQ or transparent data (first byte of the uart message != 0xFF) to the module.
- To enter the energy saving / sleep / radio off mode again CMD_SET_MODE_REQ with C1-meter mode value shall be used: 0xFF04010CF6.
- When a reset of the module happens the module will startup in the C1-meter mode as configured before (i.e. with radio rx disabled).

7.5 Recommended settings for meter emulation 868 MHz

Besides setting the user setting Mode_Preset, we highly recommend to perform the following steps if you desire to set up a meter or emulate a meter. This settings assumes unidirectional communication only (in this case: Transmitter function only). For bidirectional communication a custom firmware is required. If the meter requires battery powered operation, refer to chapter 14 and use the special UART settings listed there.

- Perform a CMD_FACTORYRESET_REQ: 0xFF1100EE
- Perform a CMD_RESET_REQ: 0xFF0500FA
- Your host UART needs to use 9600 Baud 8n1 UART (for the next couple steps)
- Set Mode_Preset to the meter sending mode you want to emulate.
For S1-m mode use CMD_SET_REQ: 0xFF0903460102B0,
for T1_meter use CMD_SET_REQ: 0xFF0903460105B7,
for C1_meter use CMD_SET_REQ: 0xFF090346010CBE
- Set the UART baud rate to 115200 Baud, using CMD_SETUARTSPEED_REQ: 0xFF100107E9
- Perform a CMD_RESET_REQ: 0xFF0500FA
- Now your host UART needs to use the configured UART baudrate (115200 Baud)
- Use CMD_DATA_REQ and provide a wM-BUS compliant frame to the module in case your host wants to send data

8 Host connection

8.1 Serial interface: UART

The configuration in factory state of the UART is 9600 Baud with data format of 8 data bits, no parity and 1 stop bit ("8n1"). The baud rate of the UART can be configured by means of the command `CMD_SETUARTSPEED_REQ`.

The output of characters on the serial interface runs with low priority. For this reason, short interruptions may occur between the outputs of individual successive bytes of the same frame. The host must not implement too strict timeouts between two Bytes to be able to receive packets that have delays in between bytes.

The UART interface is low priority in comparison to the radio interface. Thus due to shared buffers the incoming radio frames will discard any UART command that is not yet completely received when a radio frame start is detected.

For the direction "host to module" the host must respect the line `/RTS`, which will indicate that the next byte of the packet can be received by the module. If the line shows busy state during a UART frame the byte cannot be received and the complete UART rx buffer is discarded.

The module will automatically fill in the wireless M-BUS checksums, accordingly to the selected wM-BUS mode and frame format. A received frame will be checked for correct checksum and only be forwarded to the host if the checksums of the entire packet are correct. The checksums will be removed from the UART frame before it is sent to the host.

8.2 Transparent Mode

It is not recommended to use the transparent mode for transmission in productive systems. The command mode should be used instead.

The transparent mode can be used to send radio frames according to the current runtime settings of the module (i.e. wireless M-BUS Mode). Per default all received frames are also put out as transparent frames.

These wM-BUS frames will start, as described in EN13757-4, with the L field giving the number of bytes to follow in the UART frame.

The transparent output will remove the wM-BUS link layer CRC from the radio packet and in case of a frame format B frame will correct its L field accordingly.

The disadvantage of this mode is that a distinct trigger byte for a new frame is not possible as it can be any valid L field (0x0A till APP_MAXPacketLength). So we recommend using the Command Mode for any operation towards the radio module and use 0xFF plus a timeout of at least one byte duration since the last received byte as a trigger for indications and confirms.

The module will not accept a pause in the order of a byte duration in between two bytes of a single frame, in this case all previous bytes will be discarded.

The user must make sure that the frame content is wireless M-BUS compliant. See EN13757-3 and -4 for details and frame requirements. The module does not perform checks on the whole frame content for compliance.

One requirement is that any frame must start with "Block1" (in total 10 bytes) which consist of L field, C field and ALA address resulting in a minimum L field value of 0x09. As the 0xFF is reserved as commands start frame indicator the maximum L field supported is the lower value of 0xFE and APP_MAXPacketLength minus an overhead depending on the configured parameters of the user settings.

L field	Payload
[0x09.. APP_MAXPacketLength]	Payload value
1 byte	L field value bytes

Table 11: Transparent mode frame structure

When RSSI output is enabled (RSSI_Enable = 0x01) a 1 byte overhead is added and the structure changes to:

L field	Payload	RSSI
[0x09.. (APP_MAXPacketLength - 1)]	Payload value	RSSI value
1 byte	(L field value - 1) bytes	1 byte

9 The command interface

9.1 Overview

In this operating mode, the communication with the module is achieved by predefined command requests, responses and indications. These commands can be used to configure and operate the module as well as to execute special functions, trigger the transmission of frames and indicate received frames.

In this case, contrary to the transparent mode (where each telegram starts with a length byte), the telegram starts with the start frame identifier 0xFF as the first byte. This SFD is followed by the command identifier CMD, the length and the payload. The last byte transmitted in a command frame is the checksum byte. It is calculated using a XOR of all preceding bytes of this command including the SFD byte 0xFF.

Each command of type "REQ" (request) is followed by a confirmation of the module of type "CNF" (confirmation). In doing so, the respective command byte is complimented by bit 7 (mask 0x80) and returned by the module together with the respective data or status information.

Example:

The request "0x0D" produces a confirmation "0x8D" and a request "0x11" produces a confirmation "0x91".

While you did not receive a confirmation, hit a timeout of 1000 ms or got a "module busy" indicated by the */RTS* pin you shall not send any further command or transparent message towards the module and expect that all received bytes were discarded. In this case you need to resend the entire command to the module.

The module also may send indication messages at any time, also in between a received command request and its confirmation message.

SFD	CMD	Length	Payload	CS
0xFF	CMD value	n	Payload value(s)	CS value
1 byte	1 byte	1 byte	n bytes	1 byte

Table 12: Command interface generic frame structure

9.2 Message overview

The following table lists the most commonly used commands followed by a second table completing the list with the less often used commands.

Command	Value [hex]	Description
CMD_DATA_REQ	0x00	Transmission of wM-BUS data
CMD_DATA_IND	0x03	Output of received data
CMD_SET_MODE_REQ	0x04	Set the wM-Bus mode of operation in the volatile settings (Runtime settings). Shall be used when the wM-BUS mode must be changed frequently.
CMD_RESET_REQ	0x05	Reset of the module
CMD_SET_REQ	0x09	Write parameters (User settings) to the non-volatile memory
CMD_SETUARTSPEED_REQ	0x10	Set the UART baud rate to a dedicated speed
CMD_GET_REQ	0x0A	Read parameters (User settings) from the non-volatile memory
CMD_SERIALNO_REQ	0x0B	Request serial number from module
CMD_FWV_REQ	0x0C	Request firmware version from module

Table 13: Frequently used commands

Command	Value [hex]	Description
CMD_DATARETRY_REQ	0x02	Obsolete command. Do not use
CMD_SET_CHANNEL_REQ	0x06	Obsolete command. Do not use
CMD_RSSI_REQ	0x0D	Read current RSSI value from the radio
CMD_DATA_PRELOAD_REQ	0x30	Obsolete command. Do not use
CMD_DATA_CLR_PRELOAD_REQ	0x31	Obsolete command. Do not use
CMD_SET_AES_KEY_REQ	0x50	Register AES key and primary address
CMD_CLR_AES_KEY_REQ	0x51	Unregister AES key and primary address
CMD_GET_AES_DEV_REQ	0x52	Read back registered AES keys and primary addresses
CMD_RESERVED	all other	Reserved, do not use

Table 14: Further commands

9.3 Commands for sending and receiving wM-BUS radio data

9.3.1 CMD_DATA_REQ: Send data via wireless M-BUS radio

This radio transmission command serves to perform a data transfer similar to the transparent mode. The wireless M-BUS mode currently set up in the runtime settings of the module will be used as mode for transmission. Only the start byte, the command and the checksum must be added around the payload which is in this case the wM-BUS frame starting with its L field. The L field value needs to be in the range of 0x09 up to APP_MAXPacketLength.

In any RX only mode the user shall not call CMD_DATA_REQ or use transparent data transmission.

Request:

SFD	CMD	wM-BUS Frame	CS
0xFF	0x00	(L field + 1) byte	CS value

Response (CMD_DATA_CNF):

SFD	CMD	Length	Status	CS
0xFF	0x80	0x01	1 byte	1 byte

Status:

0x00: Frame was sent successfully

Any other value: Command failed, e.g. transmission error or invalid wireless M-BUS frame

9.3.2 CMD_DATA_IND: Reception of wireless M-BUS frames

The output in a command is enabled by changing the user settings parameter UART_CMD_OUT_ENABLE to 0x01.

This telegram indicates the reception of data bytes and represents the counterpart to the command CMD_DATA_REQ.

The output is similar as in transparent mode, only the start byte, the command and the checksum are added by the module. In addition the output of the RSSI value can be activated (see RSSI_Enable). In this case the L field is increased by one byte by the module.

The command will remove the wM-BUS link layer CRC from the radio packet and in case of a Frameformat B frame will correct it's L field accordingly.

Indication, with RSSI appending disabled (default):

SFD	CMD	Length	Payload	CS
0xFF	0x03	L field value	Payload value	CS value
1 byte	1 byte	1 byte	L field value bytes	1 byte

Where the L field value plus the payload values are the wM-BUS frame.

Indication, with RSSI appending enabled:

SFD	CMD	Length	Payload	RSSI	CS
0xFF	0x03	L field value + 1	Payload value	RSSI value	CS value
1 byte	1 byte	1 byte	L field value bytes	1 byte	1 byte

Where the L field value (i.e. Length - 1) with the payload values bytes are the actual wM-BUS frame.

9.4 Commands for module configuration

The configuration commands differ in their type of access. Some commands access runtime settings which are volatile parameters, some access user settings which are non-volatile parameters and some commands access read-only parameters or simply perform certain actions.

9.4.1 CMD_SET_MODE_REQ: temporarily set a wM-BUS Mode

This command changes the wM-Bus mode in the volatile memory of the module, and temporarily overrides the parameter in the runtime settings. After reboot this parameter is initialized by using the value of the non-volatile user settings parameter of Mode_Preset.

This command is suitable when the wM-BUS mode is changed frequently.

Table 15 lists the supported wM-BUS modes.

Request:

SFD	CMD	Length	Mode	CS
0xFF	0x04	0x01	1 byte	1 byte

Response (CMD_SET_MODE_CNF):

SFD	CMD	Length	Status	CS
0xFF	0x84	0x01	1 byte	1 byte

Status:

0x00: Mode was set successfully

Any other value: Command failed

In any TX only modes the module will go into sleep until the user provides a frame to be sent via CMD_DATA_REQ or via transparent transmission. Please refer to chapter 14 for details towards current optimization.

The host shall not select any wireless M-BUS Mode values not listed in the following table. Selecting those unsupported values may set the module into a non operable state and may even prevent module access through the UART interface.

The following table lists all supported wireless M-BUS modes available for the use with CMD_SET_MODE_REQ command.

wM-BUS Mode	Mode value	Direction(s)	Role
S1-m	0x02	TX only	meter
S2	0x03	TX and RX	meter or gateway
T1_meter	0x05	TX only	meter
T2_meter	0x07	RX and TX	meter
T2_other	0x08	RX and TX	gateway
C2_T2_other	0x09	RX only	gateway
C1_meter	0x0C	TX only	meter
C2_meter	0x0D	RX and TX	meter
C2_other	0x0E	RX and TX	gateway

Table 15: wM-BUS Modes for CMD_SET_MODE_REQ command at 868 MHz

9.4.2 CMD_RESET_REQ: Reset the module

This command triggers a software reset of the module. The reset is performed after the confirmation message has been issued. When restarting the module all volatile runtime settings are reset to default and any temporary changes are discarded.

Request:

SFD	CMD	Length	CS
0xFF	0x05	0x00	0xFA

Response (CMD_RESET_CNF):

SFD	CMD	Length	Status	CS
0xFF	0x85	0x01	1 byte	1 byte

Status:

0x00: Module will be reset

Any other value: Command failed

9.4.3 CMD_SET_REQ: Change non-volatile module settings

This command enables the direct manipulation of the parameters in the non-volatile memory of the module. The respective parameters (User settings, see table 18) are accessed via the memory position. Individual or multiple consecutive parameters in the memory can be modified concurrently.

Please check the supported range before modifying a parameter. The validity of the values themselves is not verified. Incorrect values can result in serious device malfunction!

To make sure the updated parameter(s) are adopted, a reset shall be applied after using one or multiple CMD_SET_REQ operations.

To save the parameters in the flash memory of the module, the particular memory segment is erased entirely and then restored from the RAM.

If a reset or supply current drop occurs during this procedure, the entire memory area may be destroyed. In this case, the module may no longer be operable.

Recommendation: First read the current configuration of the module with CMD_GET_REQ; and only modify and write if necessary. For frequent changes (e.g. of wM-BUS mode) use the command modifying the volatile parameter.

Request:

SFD	CMD	Length	Memory position	Param. length	Parameter(s)	CS
0xFF	0x09	(Parameter length + 2) bytes	1 byte	1 byte	(Param. length) bytes	1 byte

Response (CMD_SET_CNF):

SFD	CMD	Length	Status	CS
0xFF	0x89	0x01	1 byte	1 byte

Status:

0x00: Parameter(s) set successfully

0x02: Command invalid, e.g. invalid memory position, invalid parameter length

Any other value: Command failed

Any sequence of CMD_SET_REQ commands must be followed by a CMD_RESET_REQ to apply the changed values.

9.4.4 CMD_GET_REQ: Read out the non-volatile user settings

This command can be used to query individual or multiple non-volatile user parameters (User settings, see table 18). The requested number of bytes starting at the the specified memory position are returned.

Individual or multiple consecutive parameters in the memory can be queried concurrently.

The sum of the values of memory position and parameter length must be chosen to be smaller than 128.

Request:

SFD	CMD	Length	Memory position	Param. length	CS
0xFF	0x0A	0x02	1 byte	1 byte	1 byte

Response (CMD_GET_CNF):

SFD	CMD	Length	Memory position	Parameter length	Parameter(s)	CS
0xFF	0x8A	(Parameter length + 2) bytes	1 byte	1 byte	(Parameter length) bytes	1 byte

9.4.5 CMD_SERIALNO_REQ: Read out the module serial number

This command requests the serial number of the module.

Request:

SFD	CMD	Length	CS
0xFF	0x0B	0x00	0xF4

Response (CMD_SERIALNO_CNF):

SFD	CMD	Length	PID & Serial number	CS
0xFF	0x8B	0x04	4 bytes	1 byte

The most significant byte is returned first (MSB first). This byte identifies the product ("PID") and is followed by a 3 bytes serial number.

9.4.6 CMD_FWV_REQ: Read out the firmware version

This command serves to requests the firmware version. Herewith the major, minor and patch fields of the firmware version are returned.

Request:

SFD	CMD	Length	CS
0xFF	0x0C	0x00	0xF3

Response (CMD_FWV_CNF):

SFD	CMD	Length	Parameter(s)	CS
0xFF	0x8C	0x03	0x02 0x00 0x06	0x74

Where the Parameter 0x020006 is to be translated as firmware version 2.0.6.

9.4.7 CMD_RSSI_REQ: Read out the module rx level

This command returns the RX level as determined by the transceiver IC. Whenever a radio mode with reception is enabled this is a live value (i.e. noise floor level). If you want to have the receive strength of the last received packet you need to enable the RSSI output option in the user settings.

Request:

SFD	CMD	Length	CS
0xFF	0x0D	0x00	0xF2

Response (CMD_RSSI_CNF):

SFD	CMD	Length	RX level	CS
0xFF	0x8D	0x01	1 byte	1 byte

The command CMD_RSSI_REQ returns the current live RSSI value of the RF chip. The obtained value "RX level" can be used to calculate $RSSI_{dBm}$ as follows:

- Convert the hexadecimal value "RX level" as type unsigned character to a decimal $RSSI_{dec}$ value.
- if ($RSSI_{dec} \geq 128$) : $RSSI_{dBm} = (RSSI_{dec} - 256)/2 - 74$

- else ($RSSI_{dec} < 128$) : $RSSI_{dBm} = RSSI_{dec}/2 - 74$

The relation between the calculated value and the physical RX level in dBm is not linear across the entire operating range but can be assumed linear in a range from -107 dBm till -30 dBm.

Due to saturation effects the radio IC in Metis-II module, corresponding USB stick and EV-Board only displays RSSI values from -110 dBm up to -65 dBm. Stronger signals will appear as -65 dBm.

9.4.8 CMD_SETUARTSPEED_REQ: Change the UART baudrate of the module

This command changes the non-volatile parameters of the serial user interface (UART_CTL0, UART_CTL1, UART_BR0, UART_BR1, UART_MCTL) to preset values for fixed transfer rates within one command.

The index of the transfer rate is listed in table 16. Internally this command is handled like a CMD_SET_REQ using a hard coded table for abstraction of the UART baud rate to CPU register values.

The change of the baud rate takes effect after a restart of the module. The host must also be toggled to the new UART baud rate.

Index	UART baud rate
0x00	1200
0x01	2400
0x02	4800
0x03	9600
0x04	19200
0x05	38400
0x06	56000
0x07	115200
0x08 ¹	9600, ACLK

Table 16: Preconfigured baud rates of the UART interface

Request:

¹Only available for Metis-II with firmware 2.8.0 and newer. Be aware that the jitter of UART baud rate in this mode is up to $\pm 47\%$ and may cause problems with hosts not supporting this variation.

SFD	CMD	Length	Index	CS
0xFF	0x10	0x01	1 byte	1 byte

Response (CMD_SETUARTSPEED_CNF):

SFD	CMD	Length	Status	CS
0xFF	0x90	0x01	1 byte	1 byte

Status:

0x00: UART baud rate set successfully

0x02: Command invalid, e.g. invalid baudrate

Any other value: Command failed

9.4.9 CMD_FACTORYRESET_REQ: Restore factory defaults

This command resets all parameters to their factory settings. This command must be followed by a reset to apply the changes.

Request:

SFD	CMD	Length	CS
0xFF	0x11	0x00	0xEE

Response (CMD_FACTORYRESET_CNF):

SFD	CMD	Length	Status	CS
0xFF	0x91	0x01	1 byte	1 byte

Status:

0x00: Factory reset successfully

Any other value: Command failed

The UART baud rate will be reset to 9600 Baud. So the host must also switch back to this baud rate.

Registered AES keys with their relating addresses are retained.

9.5 EN13757 compliant encryption

It is not recommended to use module internal encryption functionality in a system which has a host µC available. Using integrated AES128 encryption will block the radio and UART receive path of the Metis-II module thus meaning that frames cannot be received while any AES128 operation is processed.

The following functions will allow decrypting received frames. As part of the wireless M-BUS standard some encryption modes (also called Security profiles) are introduced. The module implements means to support encryption modes 0 and 5 using AES128 (AES128 CBC) encryption. Inside the module each 16 byte key must be assigned to a wireless M-BUS address of size 8 byte.

As a wireless M-BUS frame can contain more than one address the priority of addresses when available is as follows: ALA (application layer address) then LLA (link layer address). From hereon we will call this applicable address for encryption "primary address".

The AES128 decryption is supported by the module in cases when the wM-BUS compliant frame only contains one single Ci field after Block1 introducing a short or long header (e.g. 0x5A or 0x7A as Ci field value). Frames containing more than one Ci field are not supported for en- or decryption. The encryption modes 7 and 13 as well as any encryption requiring more than one Ci field per wM-BUS frame are not supported in this Metis-II firmware. This is especially valid for not released encryption modes or encryption modes that will be introduced once the release of EN13757-7 took place.

The module has reserved storage area for up to 64 keys with their corresponding addresses.

For the management of the AES keys the command interface offers the following commands `CMD_SET_AES_KEY_REQ`, `CMD_CLR_AES_KEY_REQ` and `CMD_GET_AES_DEV_REQ`.

The following steps must be performed to decrypt a received frame, this scheme assumes that you are already receiving the encrypted frames of the meter you want to decrypt (i.e. the wireless M-BUS receive mode is already selected correctly). It is also assumed that you have the symmetric AES key of your meter as 16 byte hex and are able to perform a EN13757 compliant parsing of the raw meter data. Further the frame is assumed to have the recommended AES encryption verification bytes as the very first bytes of the first encrypted block. This bytes shall be 0x2F2F.

- perceive the "primary address" of the meter you want to receive.
- bring the meter's "primary address" into a format of an LLA (i.e. 2 bytes M field followed by 6 bytes A field, see table 17).
- locate the wM-BUS "configuration field" in a received (encrypted) frame of your meter.

- in this "configuration field": make sure that it is indicating encryption mode 5 and at least 1 block of encrypted data (i.e. sub-field "number of encrypted blocks" > 0).
- if required convert the meter's AES key into 16 bytes of hex coded values and order it as LSB first.
- register the key and primary address to the module using the `CMD_SET_AES_KEY_REQ` command.
- enable the global AES encryption support by setting `APP_AES_Enable` to 0x01.
- reboot the module by `CMD_RESET_REQ` or by using the `/RESET` pin.
- upon a received frame of your meter:
 - if it shows "number of encrypted blocks" = 0 you have a decrypted frame which you now need to parse according to EN13757 to gain readable data.
 - the first decrypted data shall be 0x2f2F (two times idle filler) the so called AES encryption verification. This allows you to detect if the decryption was successful.
 - if it shows "number of encrypted blocks" > 0 you have either entered a wrong key, meter address or the wM-BUS frame does not match the requirements (described above) to be decrypted by the module.

9.5.1 `CMD_SET_AES_KEY_REQ`: Register a pair of key and address in the module

With this command an AES key (in hex notation) and a device address (in hex notation) can be stored in the non-volatile memory. The AES key is then used for encryption and decryption. The address fields of a device are to be transmitted exactly as shown below (i.e. in the LLA format). The AES key shall be transmitted LSB first.

Request:

SFD	CMD	Length	Primary address	Key	CS
0xFF	0x50	0x18	Address value	AES Key value	CS value
1 byte	1 byte	1 byte	8 byte	16 byte	1 byte

Response (`CMD_SET_AES_KEY_CNF`):

SFD	CMD	Length	Status	CS
0xFF	0xD0	0x01	1 byte	1 byte

Status:

0x00: Key and address set successfully

0x02: All 64 storage locations are already in use

Any other value: Command failed

The fields of the primary address in LLA format are composed as follows.

Primary address							
M field LSB	M field MSB	ID LSB	ID (LSB+1)	ID (LSB+2)	ID (MSB)	Version	Device type
1 byte	1 byte	1 byte	1 byte	1 byte	1 byte	1 byte	1 byte

Table 17: Content and order of primary address

9.5.2 CMD_CLR_AES_KEY_REQ: Clear AES key from list

This command can be used to delete a specific AES key and address pair from the list.

Using this command will consume one flash cycle. Therefore unnecessary use of this command shall be avoided.

Request:

SFD	CMD	Length	Primary address	CS
0xFF	0x51	0x08	8 bytes	1 byte

Please refer to table 17 for primary address order and content.

Response (CMD_CLR_AES_KEY_CNF):

SFD	CMD	Length	Status	CS
0xFF	0xD1	0x01	1 byte	1 byte

Status:

0x00: Key and address deleted successfully

0x02: Address or key not found

Any other value: Command failed

9.5.3 CMD_GET_AES_DEV_REQ: Read Back registered addresses

With this command the addresses of registered devices can be requested. The addresses are saved in 4 banks (0x00 - 0x03). Only one bank (containing up to 16 registered addresses) at a time can be requested to be read with this command. For security reasons the AES keys cannot be read back. Unused or uninitialized addresses can have either all 8 bytes 0x00 or all

8 bytes 0xFF.

Request:

SFD	CMD	Length	Bank index	CS
0xFF	0x52	0x01	1 byte	1 byte

Response (CMD_GET_AES_KEY_CNF):

SFD	CMD	Length	16 × Primary address	CS
0xFF	0xD2	0x80	Primary address values	1 byte

10 User settings - Module configuration values

The application's non-volatile parameters are listed in the following tables. They can be written by means of a `CMD_SET_REQ` and read back by a `CMD_GET_REQ` by any suitable terminal program or any host µC.

The Windows software "ACC" offers a GUI to conveniently modify these settings.

Only the parameters described in tables 18 and 19 shall be adopted if required. Not described or obsolete parameters shall not be changed by the user.

These parameters are permanently (non-volatile) stored in the flash memory of the module. To apply these parameters after modification, a module restart is required. To avoid frequent writes a user shall first perform a `CMD_GET_REQ` and check if the value needs to be changed before sending a `CMD_SET_REQ`.

If not notified otherwise, any multi byte field with size > 1 shall be transmitted LSB first to the module

The WOR function for a cyclic "wakeup - listen - sleep" applications shall not be used anymore as it will be removed in future firmware releases. For a standalone functionality request a custom firmware through our sales channels.

Parameter	Description	Address offset (dec)	Size (bytes)	Value range (dec)	Default value (dec)
UART_CMD_OUT_ENABLE	Enable <code>CMD_DATA_IND</code> output format	5	1	0, 1	0
RF_Power	Radio output power index	61	1	0 - 6	6
RSSI_Enable	Enable RSSI output	69	1	0, 1	0
Mode_Preset	Default wM-BUS mode	70	1	1 - 15	3

Table 18: Table of user settings

In any normal application the following settings shall not be used or changed.

For changing the UART baudrate the dedicated command `CMD_SETUARTSPEED_REQ` or the ACC PC tool shall be used.

Parameter	Description	Address offset (dec)	Size (bytes)	Value range (dec)	Default value (dec)
UART_CTL0	UART register	0	1	use ACC	use ACC
UART_CTL1	UART register	1	1	use ACC	use ACC
UART_BR0	UART register	2	1	use ACC	use ACC
UART_BR1	UART register	3	1	use ACC	use ACC
UART_MCTL	UART register	4	1	use ACC	use ACC
APP_MAXPacketLength	Maximum UART packet length	10	1	10 - 254	250
APP_AES_Enable	Enable encryption	11	1	0, 1	0
RF_AutoSleep	Sleep mode	63	1	0, 2	0
CFG_Flags	Configuration flags	80	2	0 - 65535	0

Table 19: Further user settings

10.1 UART parameters

The following sections describe the host communication interface specific settings of the wM-BUS module.

10.1.1 UART speed parameters

For changing the UART speed settings please only use either the dedicated `CMD_SET_REQ` shown here, the special command `CMD_SETUARTSPEED_REQ` or the ACC PC tool.

For enabling the full low power optimization of the wM-BUS radio modules a special host interface speed and setting must be configured. The UART needs to run at 9600 Baud 8n1 using ACLK. This can be achieved using the following command `CMD_SET_REQ` or if available for Metis-II the `CMD_SETUARTSPEED_REQ` with parameter 0x08 (see chapter 16).

`CMD_SET_REQ` with memory index 0x00, parameter length 0x05 and parameter value 0x0040030006:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x07	0x00	0x05	0x0040030006	0xB1

`CMD_SETUARTSPEED_REQ` with parameter 0x08 (see chapter 16):

SFD	CMD	Length	Parameter(s)	CS
0xFF	0x10	0x01	0x08	0xE6

A CMD_RESET_REQ or pin reset is required to apply the changed settings. Your host must be also configured to 9600 Baud and allow up to 47% deviation in RX and TX directions.

10.1.2 UART_CMD_OUT_ENABLE

If this parameter is set to 0x01, all received radio frames will be transmitted by the UART as CMD_DATA_IND. The default value for this parameter is 0x00.

A CMD_RESET_REQ or pin reset is required to apply the changed settings.

Request, enable command output for received radio frames:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x03	0x05	0x01	0x01	0xF0

Request, disable command output for received radio frames:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x03	0x05	0x01	0x00	0xF1

Response, with status "success":

SFD	CMD	Length	Status	CS
0xFF	0x89	0x01	0x00	1 byte

10.2 Application and Radio Parameters

10.2.1 APP_MAXPacketLength

The maximum radio packet length can be set by means of this parameter. It limits the number of bytes usable for transparent communication and CMD_DATA_REQ as well as CMD_DATA_IND. The default value for this parameter equals 250 (0xFA).

Frames exceeding this value are discarded without notification.

A CMD_RESET_REQ or pin reset is required to apply the changed settings.

Request, set max. L field to size 250:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x03	0x0A	0x01	0xFA	0x04

Response, with status "success":

SFD	CMD	Length	Status	CS
0xFF	0x89	0x01	0x00	1 byte

10.2.2 APP_AES_Enable

This parameter enables or disables the integrated encryption function of the module. Additional to this parameter, a suitable 16 byte AES key with its primary address has to be registered in the module to run the frame decryption. Please also refer to chapter 9.5 for further commands needed for encryption.

A CMD_RESET_REQ or pin reset is required to apply the changed settings.

Request, AES enabled:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x03	0x0B	0x01	0x01	0xFE

Request, AES disabled:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x03	0x0B	0x01	0x00	0xFF

Response, with status "success":

SFD	CMD	Length	Status	CS
0xFF	0x89	0x01	0x00	1 byte

To avoid additional latency this option shall stay disabled. Decryption of longer frames may take several milliseconds. During this time radio reception cannot be active due to hardware restrictions.

10.2.3 RF_Power

Sets the level of the transmission power in the radio IC.

The user shall adopt this value for his or her design in such a way that the statutory regulations (e.g. in Europe the RED) is adhered to. The provided default values were verified on Metis-II-EV 50 Ω conducted. In customer hardware the behavior of the module will be different and therefore it is mandatory to adopt this setting.

Value	radio IC Power in dBm
1	-5
2	0
3	+5
4	+7
5	+10
6	+14

Table 20: Parameter RF_Power of wM-BUS modules with up to 25mW output power

A CMD_RESET_REQ or pin reset is required to apply the changed settings.

Request minimum RF_Power:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x03	0x3D	0x01	0x01	0xC8

Request maximum RF_Power:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x03	0x3D	0x01	0x06	0xCF

Response, with status "success":

SFD	CMD	Length	Status	CS
0xFF	0x89	0x01	0x00	1 byte

10.2.4 RSSI_Enable

This parameter determines whether the RSSI value will be appended to the payload data or not (last byte before CS in a CMD_DATA_IND or very last byte in transparent output). The L field on the UART output will be increased by +1 when RSSI output is enabled. If enabled the wM-BUS frame itself is limited to a size of APP_MAXPacketLength -1.

A CMD_RESET_REQ or pin reset is required to apply the changed settings.

Request, RSSI output enabled:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x03	0x45	0x01	0x01	0xB0

Request, RSSI output disabled:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x03	0x45	0x01	0x00	0xB1

Response, with status "success":

SFD	CMD	Length	Status	CS
0xFF	0x89	0x01	0x00	1 byte

10.2.5 Mode_Preset

Default settings of the operating modes specified in wM-BUS Standard can be selected by means of this parameter. The value can be modified using the CMD_SET_REQ command.

The wM-BUS standard only allows frame format A for S, F and T mode in order to be compliant. The C and N modes support both frame format A and B reception and will automatically use the frame format of the last received frame for sending, which may be frame format A or B. The initial value is frame format A in case no frame was received yet.

Selecting wM-BUS modes not listed in the following table shall not be used in this command.

Selecting those invalid values may set the module into a non operable state and prevent module access through the UART interface.

wM-BUS mode	Mode value	Direction(s)	Role
S1-m	0x02	TX only	meter
S2	0x03	TX and RX	meter or gateway
T1_meter	0x05	TX only	meter
T2_meter	0x07	RX and TX	meter
T2_other	0x08	RX and TX	gateway
C2_T2_other	0x09	RX only	gateway
C1_meter	0x0C	TX only	meter
C2_meter	0x0D	RX and TX	meter
C2_other	0x0E	RX and TX	gateway

Table 21: wM-BUS modes for Mode_Preset in the 868 MHz band

Mode C2_T2_other (0x09) is only suited for receiving frames. In order to send frames either T2_other (0x08) or C2_other (0x0E) must be used.

This special mode 0x09 shall not be used for range critical applications as the receiver sensitivity is reduced in comparison to the single wM-BUS mode receive option T2_other and C2_other.

A CMD_RESET_REQ or pin reset is required to apply the changed settings.

Request, select S2 mode:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x03	0x46	0x01	0x03	0xB1

Request, select C2_T2_other RX only mode:

SFD	CMD	Length	Memory index	Param.) length	Parameter(s)	CS
0xFF	0x09	0x03	0x46	0x01	0x09	0xBB

Request, Select C1_meter TX only mode:

SFD	CMD	Length	Memory index	Param. length	Parameter(s)	CS
0xFF	0x09	0x03	0x46	0x01	0x0C	0xBE

Response, with status "success":

SFD	CMD	Length	Status	CS
0xFF	0x89	0x01	0x00	1 byte

10.2.6 RF_AutoSleep

The parameter RF_AutoSleep supports 2 different settings.

The WOR (periodic wakeup) function is obsolete and shall not be used anymore. We can offer this function in a customer specific firmware that can be requested through our sales team.

Value		Description
0x00	RX	The auto sleep function can be disabled. The module is permanently in RX mode if the selected Mode_Preset has an RX mode. Data can be received at all times.
0x01	WOR	Obsolete. Do not use.
0x02	Sleep	Between the transmissions, the module is always in the sleep mode (no reception at all). In this mode, the module has the lowest power consumption, since the radio chip and µC are in the low-power state. This lowest current consumption can only be achieved when the UART Baud rate is 9600 or below and the UART clock is set to use the watch crystal. Higher baud rates require faster reaction thus leading to less efficient sleep modes resulting in higher current consumption. Consider using the settings described in chapter 14. By communication on the UART the module can be contacted at all times for transmitting data or for configuration purposes.

Table 22: Values for RF_AutoSleep parameter

10.2.7 CFG_Flags

This 2 byte parameter provides the ability to run different module configurations. It serves to activate various pin functions.

All pin functions are disabled in the factory state, so that the normal pin configuration is compatible with previous modules. For a description of the flags, see table 23.

Bit index	Mask	Description
0	0x0001	If set, this bit activates the function of the pin /RTS. This pin indicates whether the internal buffer is currently busy (/RTS = high) or not. When busy all received bytes (radio or UART) will be discarded without further user notification.
1	0x0002	If set, this bit activates the function of the pin /CTS. This pin will be queried by the UART driver before another byte is sent by the module. The host must use this pin accordingly (LOW = data will be sent to host, HIGH = data will be delayed till /CTS is low again, radio and uart rx will be disabled until /CTS is low).
2	0x0004	Obsolete. If set, this bit activates the function of the pin /DATA IND. This pin will indicate whether data is ready for output via UART. It can be used, for example, to wake a host processor.
3 - 15	0xFFFF8	Reserved. All bits must be '0'

Table 23: Parameters for CFG_Flags

10.3 Obsolete configuration parameters

The following parameters are not recommended to be used anymore. If your application requires those parameters you are encouraged to adopt your application or request a custom firmware version for your application through our sales team.

Parameter	Description	Address offset (dec)
UART_DIDelay	Configurable output delay	6
APP_WOR_PeriodH	WOR period factor msb	28
APP_WOR_PeriodL	WOR period factor lsb	29
APP_WOR_MultiplierH	WOR multiplier factor msb	30
APP_WOR_MultiplierL	WOR multiplier factor lsb	31
APP_WOR_RX_Time	WOR listen active time in between sleep and wake-up	32
MBUS_RXTimeout	Time in ms that the module remains in the RX mode after transmitting data	43
MBUS_FrameFormat	RX frame Frameformat filter	44
Config_CRC_Disable	Accept any UART CS in commands	72

Table 24: Obsolete user settings

11 Timing parameters

11.1 Reset behavior

Following a reset (by `CMD_RESET_REQ` or pin `/RESET`), a stable LOW level over a duration of at least 5ms on the `/RTS` pin signalizes that the module is ready for operation.

During restart the `/RTS` may be pulled to `GND` level for a short time until it is configured accordingly by the application on the module.

11.1.1 Reset via `/RESET` pin

To force a module restart by means of the `/RESET` pin, it must first be set to LOW for at least 1 ms. After the pin is released, the module will reboot.

Recommended procedure: After the `/RESET` pin is released, wait for up to 1000 ms for the stable LOW level on the `/RTS` pin.

This section applies only to a situation where the VCC is stable and the module was already running. Additional timings are needed when VCC was just applied to the module, see chapter 6.2

12 Information for explosion protection

In case the end product should be used in explosion protection areas the following information can be used:

- The module itself is unfused.
- The maximum output power of the module is 14 dBm.
- The total amount of capacitance of all capacitors is 335.9 nF.
- The total amount of inductance of all inductors is 62.5 nH.

13 Radio parameters

13.1 Wireless M-BUS radio parameters

The EN 13757-4 defines wireless M-BUS modes which are implemented by the modules for being able to send and receive conforming frames. Modules that support N mode (169 MHz) cannot support S, T or C mode (868 MHz) and vice versa. But they are exchangeable as they share the same footprint, pin functions and command interface.

The wM-BUS mode is mapped to the user settings parameter `Mode_Preset`. It may be modified temporarily during runtime by using the command `CMD_SET_MODE_REQ` or be altered in a non-volatile way using the command `CMD_SET_REQ`.

Setting a corresponding `Mode_Preset` with RX support is sufficient to receive wM-BUS frames complying to EN13757. For sending data a mode with TX support needs to be selected. The host must then transfer a wM-BUS conforming frame inside a `CMD_DATA_REQ` or in transparent mode via UART to the module which will then send this frame with the selected wM-BUS mode.

The module performs some filtering of non EN13757-3:2013 compliant frames. Non compliant frames will be discarded without host notification.

The `C2_T2_other` mode is not defined in the standard but was implemented to be able to receive both T and C mode meters in one mode. This receive only mode is suited for data collectors without communication back to the meter (no downlink support).

wM-BUS Mode	Direction	Frequency [MHz]	Chiprate [kcps]	Coding
S1-m	TX only	868.300	32.768	Manchester
S2	RX	868.300	32.768	Manchester
S2	TX	868.300	32.768	Manchester
T1_meter	TX only	868.950	100	3 out of 6
T2_other	RX	868.950	100	3 out of 6
T2_other	TX	868.300	32.768	Manchester
C1_meter	TX only	868.950	100	NRZ
C2_other	RX	868.950	100	NRZ
C2_other	TX	869.525	50	NRZ
C2_T2_other	RX only	868.950	100	auto detect

Table 25: wM-BUS mode radio settings for 868 MHz

Transmit mode	Suitable receive mode
S1-m	S2
S2	S2
T1_meter	T2_other or T2_C2_other
T2_meter	T2_other or T2_C2_other
T2_other	T2_meter
C1_meter	C2_other or T2_C2_other
C2_meter	C2_other or T2_C2_other
C2_other	C2_meter

Table 26: Compatible wM-BUS modes for 868 MHz

The data rate can be calculated by combining chip rate and coding.

In Manchester coding the factor is $\frac{1}{2}$ meaning the data rate for uplink and downlink is $\frac{32.768}{2} = 16.384$ kbps

The 3 out of 6 coding will introduce a factor of $\frac{2}{3}$ so the T mode uplink data rate is $100 \times \frac{2}{3} = 66.667$ kbps.

NRZ coding has a factor of 1 resulting in 100 kbps uplink and 50 kbps downlink data rate for C mode and in 4.8 kbps and 2.4 kbps for the different N sub-modes.

13.2 EU regulation

The module is tested through an accredited test lab to conform to the requirements of the RED. The module complies to receiver category 2.

That means at 50Ω conducted on the corresponding EV-Board all requirements are met. Decisive for the end product is the effective radiated power. The power depends on the selected antenna, the wiring to the antenna, the quality of the power supply, possible disturbances etc., and should therefore be tested in the customer application.

An important aspect to comply with the radio regulatory is to adhere to the requirements of the duty cycle. The duty cycle is the ratio expressed as a percentage of the cumulative duration of transmission $T_{on,cum}$ within an observation time interval of T_{obs} . $DC = (T_{on,cum}/T_{obs})F_{obs}$ on an observation bandwidth F_{obs} . Unless otherwise specified, T_{obs} is 1 hour and the observation bandwidth F_{obs} is the operational frequency band.

There are no mechanisms for constraining the duty cycle in the firmware. The customer is fully responsible for the compliance of the duty cycle.

The wireless M-Bus modes of the Metis-II fall into two sub bands of the EN 300 220:

- Band M
868 MHz - 868.6 MHz
Output power ≤ 14 dBm
Duty cycle $\leq 1\%$ or PSA

- Band N
868.7 MHz - 869.2 MHz
Output power ≤ 14 dBm
Duty cycle $\leq 0.1\%$ or PSA

The EN 300 220 allows a specific tx duration when the standard complying PSA method is implemented in the module firmware. The standard Metis-II firmware does not implement PSA. With PSA a transmission time of 100 s/h (3.6%) is possible.

14 Battery powered operation

If the parameter `RF_AutoSleep` is set to sleep (0x02), the module will be in sleep mode, if no data transmission is requested by the host. During this time, the reception of frames via radio is disabled.

If the listening shall be controlled by the host, the module can be set to the RX mode by reconfiguring this parameter to full active mode (`RF_AutoSleep` = 0x00). As this will use a `CMD_SET_REQ` and therefore consume a flash cycle the host shall not perform this procedure too often.

If a message is received during this time, the module will forward this message to the host and subsequently go back to sleep again.

We highly recommend requesting a custom firmware for any battery operated system so optimizations can be implemented and tested accordingly to the system requirements and use cases.

UART baud rates of more than 9600 Baud or not using the ACLK as UART clock source result in higher current consumption as the sleep mode cannot be activated in the μ C.

Non terminated module pads will introduce leakage current. Make sure you adopt the module design according to the corresponding chapters for design in and pinout.

Depending on the hardware platform some specific further steps are required as explained in the following section.

14.1 Metis-II (AMB8626-M)

Due to its implemented μ C the Metis-II has specific requirements to be able to achieve an optimized sleep current:

- The firmware version shall be the most recent release for Metis-II
- The following user settings for UART (9600 Baud 8n1 with ACLK use) must be used
 - `UART_CTL0` = 0x00
 - `UART_CTL1` = 0x40
 - `UART_BR0` = 0x03
 - `UART_BR1` = 0x00
 - `UART_MCTL` = 0x06
- the Metis-II module pads must be implemented as described in the chapter 5.

Using a single CMD_SET_REQ for enabling UART settings can be achieved by sending the following command to the module.

SFD	CMD	Length	Memory index	length	parameter(s)	CS
0xFF	0x09	0x07	0x00	0x05	0x0040030006	0xB1

A CMD_RESET_REQ or pin reset is required to apply the changed settings.

Caution: Using this UART setting will introduce an error of up to 47% (e.g. see Texas Instruments MSP430 F5xxx family user guide chapter 36, table 36-4). This is hardware related and cannot be avoided when the UART shall stay active using this HW-platform during efficient sleep state.

- The RX_Timeout must be 0x00 (which is the default setting)
- When RF_AutoSleep = 0x00 the parameter Mode_Preset must be set to either of the following modes which are TX only modes (indicated by the "1" in the mode name).
 - S1-m
 - T1_meter
 - T1_other
 - C1_meter
 - C1_other
- As an alternative the parameter RF_AutoSleep must be set to 0x02 when any supported Mode_Preset that also supports RX shall be used. Please have in mind that RF_AutoSleep = 0x02 will disable RX in this modes.
- RF_AutoSleep must not be set to 0x01 (WOR)

15 Custom firmware and configuration

Any kind of configuration and firmware, which is provided as Intel hex file, can be programmed on the radio module at Würth Elektronik eiSos production site.

In case of interest, please contact your Business Development Manager (BDM) or *WCS@we-online.com*.

15.1 Custom configuration of standard firmware

The configuration of the standard firmware includes adoption of the non-volatile settings to customer requirements and creating a customized product based on the standard product.

This variant will result in a customer exclusive module with a unique ordering number. It will also freeze the firmware version to a specific and customer tested version and thus results in a customer exclusive module with a unique ordering number.

Further scheduled firmware updates of the standard firmware will not be applied to this variant automatically. Applying updates or further functions require a customer request and release procedure.

15.2 Customer specific firmware

A customer specific firmware may include "Custom configuration of standard firmware" plus additional options or functions and tasks that are customer specific and not part of the standard firmware.

Further scheduled firmware updates of the standard firmware will not be applied to this variant automatically. Applying updates or further functions require a customer request and release procedure.

This also results in a customer exclusive module with a unique ordering number.

An example for this level of customization are functions like host-less operation where the module will perform data generation (e.g. by reading a SPI or I²C sensor) and cyclic transmission of this data to a data collector, while sleeping or being passive most of the time.

Also replacing UART with SPI as host communication interface is classified as a custom specific option.

Certification critical changes need to be re-evaluated by an external qualified measurement laboratory. These critical changes may occur when e.g. changing radio parameters, the channel access method, the duty-cycle or in case of various other functions and options possibly used or changed by a customer specific firmware.

15.3 Customer firmware

A customer firmware is a firmware written and tested by the customer himself or a 3rd party as a customer representative specifically for the hardware platform provided by a module.

This customer firmware (e.g. in form of an Intel hex file) will be implemented into the module's production process at our production site.

This also results in a customer exclusive module with a unique ordering number. The additional information needed for this type of customer firmware, such as hardware specific details and details towards the development of such firmware are not available for the public and can only be made available to qualified customers.

The qualification(s) and certification(s) of the standard module cannot be applied to this customer firmware solution without a review and verification.

16 Firmware updates

All products will experience maintenance, security and/or feature updates from time to time. For the standard products these maintained via the PCN process.

Customers can request the creation of a customized product including a "firmware freeze" to ensure that they will receive their verified product even if the standard product is updated.

16.1 Firmware flashing using the production interface

Most Würth Elektronik eiSos wireless connectivity modules offer a production interface (e.g. JTAG, SWD, Spy-Bi-Wire) for module flash access. Depending on the product, this interface can be used by customers to erase the entire chip and install their own firmware.

Using the production interface is not intended to perform updates of Würth Elektronik eiSos standard product firmware.

Production firmware images and binary files for Würth Elektronik eiSos wireless connectivity modules are not publicly available.

Any certification, declaration, listing and qualification becomes invalid if the production interface is used by a customer. Some products, in their documentation, state exceptions to this invalidation under certain conditions.

Customers shall make the product specific firmware update interface available to their application. These methods will use a wired (UART, SPI, etc.) or wireless (Bluetooth® LE, WiFi, etc.) communication interface of the module to allow updating the product's firmware. Details are described in the next sections.

16.2 Update via ACC Software and UART

Only the *UTDX*, *URXD* and *GND* signals are needed for this connection. A suitable adapter-converter is required for a PC connection (e.g. the FTDI TTL-323R-3V3 UART to USB converter).

None of the module pins are 5 V TTL compatible. Applying overvoltage to any pin may damage the hardware permanently. Ensure your levels are in the range of the electrical specification as shown in chapter 4

Users must make sure that their host is not accessing the Metis-II RX line (i.e. pulling it HIGH or LOW) as that will prevent ACC to access the module.

As long as our standard firmware is running on the module, it can be updated with the PC utility "ACC" via the serial interface. If the module is not directly connected to a PC, then at least the UART should be made accessible, e.g. by means of a suitable connector. ACC can be downloaded from the Würth Elektronik eiSos homepage: ACC.

17 Firmware history

Version 2.7.3 "Release"

- Initial release.

Version 2.8.0 "Release as 2607021183010"

- Added C field filter for Bit7. According to EN13757, packets will be discarded if this bit is not '0'.
- Unused pins are pulled to low level (i.e. configured to output low).
- Adopted new release revision numbering.
- Added ANR001 Metis-II 2607021183010 for describing the newly included limited unidirectional repeater functionality in detail.

Version 2.9.0 "Release"

- Added the energy constrained data collector ("sleepy receiver") use case
- Application flow was created to allow this usecase
- Buffers are allocated to allow reception for this use case

If you do not have this use case no adaptation on host side is required except that the value of firmware version is now 2.9.0 in case the host is reading and checking this parameter.

17.1 Known issues

Index	Details	Affected versions
KI-001	<p>Description: In high traffic scenarios, commands are not accepted.</p> <p>Affected functions: System configuration.</p> <p>Workaround: For module configuration use either ACC or avoid high traffic zones.</p>	All

KI-002	<p>Description: In C Mode with frame format B extreme long (>16 byte) sequences of 0x00 or 0xFF (which are only possible in non encrypted frames and inside a manufacturer specific data block) cause the radio chip to loose bit-sync. This leads to CRC errors and the packet is lost.</p> <p>Affected functions: Radio frame reception.</p> <p>Workaround: Make sure you either use frame format A, encrypt your frame or reorder your data blocks in a way such long sequences cannot occur.</p>	≤ 2.8.0
--------	--	---------

18 Design in guide

18.1 Advice for schematic and layout

For users with less RF experience it is advisable to closely copy the relating EV-Board with respect to schematic and layout, as it is a proven design. The layout should be conducted with particular care, because even small deficiencies could affect the radio performance and its range or even the conformity.

The following general advice should be taken into consideration:

- A clean, stable power supply is strongly recommended. Interference, especially oscillation can severely restrain range and conformity.
- Variations in voltage level should be avoided.
- LDOs, properly designed in, usually deliver a proper regulated voltage.
- Blocking capacitors and a ferrite bead in the power supply line can be included to filter and smoothen the supply voltage when necessary.
- Elements for ESD protection should be placed on all pins that are accessible from the outside and should be placed close to the accessible area. For example, the RF-pin is accessible when using an external antenna and should be protected.
- ESD protection for the antenna connection must be chosen such as to have a minimum effect on the RF signal. For example, a protection diode with low capacitance such as the 8231606A or a 68 nH air-core coil connecting the RF-line to ground give good results.
- Placeholders for optional antenna matching or additional filtering are recommended.
- The antenna path should be kept as short as possible.
- The use of an external reset IC should be considered if one of the following points is relevant:
 - The slew rate of the power supply exceeds the electrical specifications.
 - The effect of different current consumptions on the voltage level of batteries or voltage regulators should be considered. The module draws higher currents in certain scenarios like start-up or radio transmit which may lead to a voltage drop on the supply. A restart under such circumstances should be prevented by ensuring that the supply voltage does not drop below the minimum specifications.
 - Voltage levels below the minimum recommended voltage level may lead to malfunction. The reset pin of the module shall be held on LOW logic level whenever the VDD is not stable or below the minimum operating Voltage.
 - Special care must be taken in case of battery powered systems.
- To avoid the risk of short circuits and interference there should be no routing underneath the module on the top layer of the baseboard.
- On the second layer, a ground plane is recommended, to provide good grounding and shielding to any following layers and application environment.

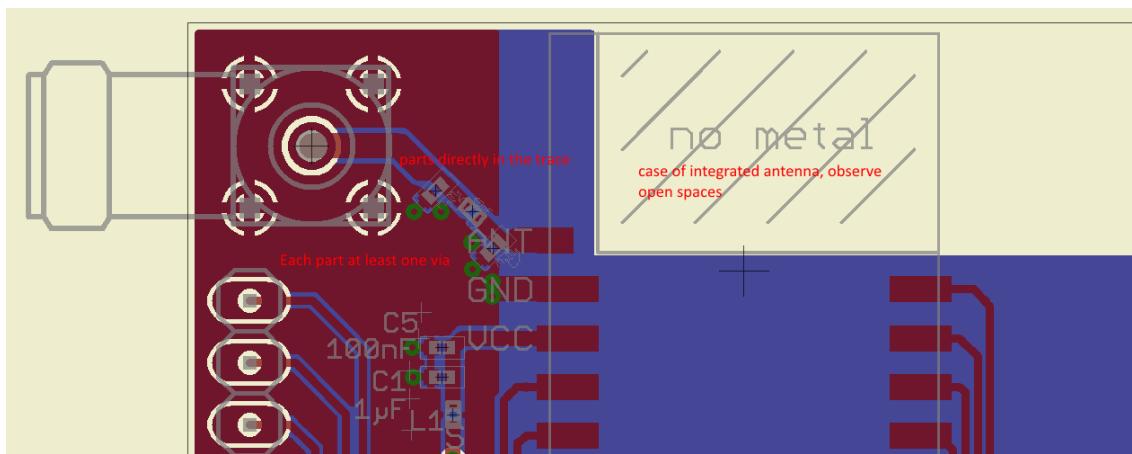

Figure 3: Layout

- In case of integrated antennas it is required to have areas free from ground. This area should be copied from the EV-Board.
- The area with the integrated antenna must overlap with the carrier board and should not protrude, as it is matched to sitting directly on top of a PCB.
- Modules with integrated antennas should be placed with the antenna at the edge of the main board. It should not be placed in the middle of the main board or far away from the edge. This is to avoid tracks beside the antenna.
- Filter and blocking capacitors should be placed directly in the tracks without stubs, to achieve the best effect.
- Antenna matching elements should be placed close to the antenna / connector, blocking capacitors close to the module.
- Ground connections for the module and the capacitors should be kept as short as possible and with at least one separate through hole connection to the ground layer.
- ESD protection elements should be placed as close as possible to the exposed areas.

Fixed values can not be recommended, as these depend on the circumstances of the application (main power source, interferences etc.).

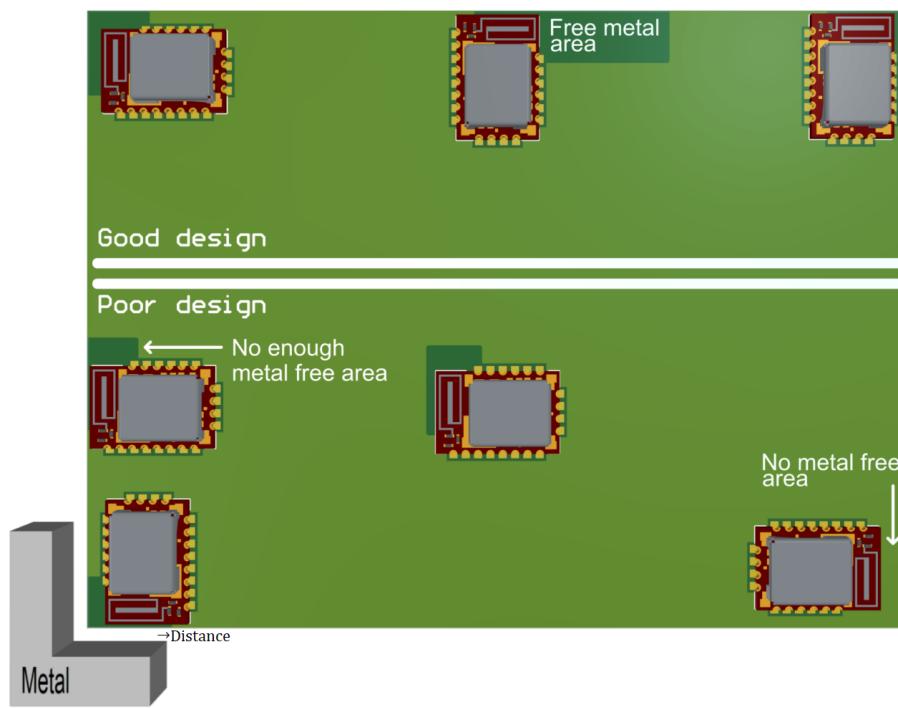

Figure 4: Placement of the module with integrated antenna

18.2 Designing the antenna connection

The antenna should be connected with a 50Ω line. This is needed to obtain impedance matching to the module and avoids reflections. Here we show as an example how to calculate the dimensions of a 50Ω line in form of a micro strip above ground, as this is easiest to calculate. Other connections like coplanar or strip line are more complicated to calculate but can offer more robustness to EMC. There are free calculation tools available in the internet.

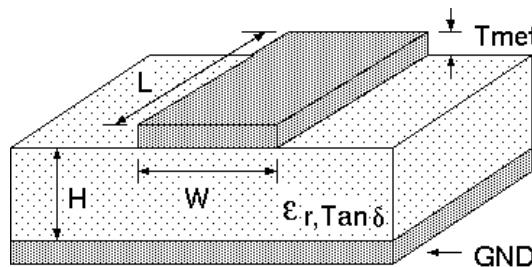

Figure 5: Dimensioning the antenna connection as micro strip

The width W for a micro strip can be calculated using the following equation:

$$W = 1.25 \times \left(\frac{5.98 \times H}{e^{\frac{50 \times \sqrt{\epsilon_r} + 1.41}{87}}} - T_{met} \right)$$

Example:

A FR4 material with $\epsilon_r = 4.3$, a height $H = 1000 \mu\text{m}$ and a copper thickness of $T_{met} = 18 \mu\text{m}$ will lead to a trace width of $W \sim 1.9 \text{ mm}$. To ease the calculation of the micro strip line (or e.g. a

coplanar) many calculators can be found in the internet.

- As rule of thumb a distance of about $3 \times W$ should be observed between the micro strip and other traces / ground.
- The micro strip refers to ground, therefore there has to be the ground plane underneath the trace.
- Keep the feeding line as short as possible.

18.3 Antenna solutions

There exist several kinds of antennas, which are optimized for different needs. Chip antennas are optimized for minimal size requirements but at the expense of range, PCB antennas are optimized for minimal costs, and are generally a compromise between size and range. Both usually fit inside a housing.

Range optimization in general is at the expense of space. Antennas that are bigger in size, so that they would probably not fit in a small housing, are usually equipped with a RF connector. A benefit of this connector may be to use it to lead the RF signal through a metal plate (e.g. metal housing, cabinet).

As a rule of thumb a minimum distance of $\lambda / 10$ (which is 3.5 cm @ 868 MHz and 1.2 cm @ 2.44 GHz) from the antenna to any other metal should be kept. Metal placed further away will not directly influence the behavior of the antenna, but will anyway produce shadowing.

Keep the antenna as far as possible from large metal objects to avoid electro-magnetic field blocking.

In the following chapters, some special types of antenna are described.

18.3.1 Wire antenna

An effective antenna is a $\lambda / 4$ radiator with a suiting ground plane. The simplest realization is a piece of wire. Its length is depending on the used radio frequency, so for example 8.6 cm 868.0 MHz and 3.1 cm for 2.440 GHz as frequency. This radiator needs a ground plane at its feeding point. Ideally, it is placed vertically in the middle of the ground plane. As this is often not possible because of space requirements, a suitable compromise is to bend the wire away from the PCB respective to the ground plane. The $\lambda/4$ radiator has approximately 40Ω input impedance. Therefore, matching is not required.

18.3.2 Chip antenna

There are many chip antennas from various manufacturers. The benefit of a chip antenna is obviously the minimal space required and reasonable costs. However, this is often at the expense of range. For the chip antennas, reference designs should be followed as closely as possible, because only in this constellation can the stated performance be achieved.

18.3.3 PCB antenna

PCB antenna designs can be very different. The special attention can be on the miniaturization or on the performance. The benefits of the PCB antenna are their small / not existing (if PCB space is available) costs, however the EV of a PCB antenna holds more risk of failure than the use of a finished antenna. Most PCB antenna designs are a compromise of range and space between chip antennas and connector antennas.

18.3.4 Antennas provided by Würth Elektronik eiSos

Besides the radio modules Würth Elektronik eiSos provides various antennas tailored for the different frequency bands. The recommended single external antennas are shown in the subsequent chapters.

In case integrated multilayer chip antennas are needed because of space limitations, please refer to

<https://www.we-online.com/en/components/products/WE-MCA>.

18.3.4.1 2600130086 - Hermippe-III dipole antenna

Well suited for applications where the RF is lead through a metal wall that could serve as ground plane to the antenna.

Figure 6: Hermippe-III dipole antenna

Specification	Value
Frequency range [MHz]	855 – 915
VSWR (free space,without ground plane)	≤ 2.0
Polarisation	Linear
Impedance [Ω]	50 ± 5
Connector	SMA (Male)
Dimensions (L x d) [mm]	$50 \pm 3 \times 7.92 \pm 0.2$
Weight [g]	4.5
Operating temp. [°C]	-40 – +85

18.3.4.2 2600130081 - Hyperion-I dipole antenna

Figure 7: Hyperion-I dipole antenna

Ideally suited for applications where no ground plane is available.

Specification	Value
Center frequency [MHz]	868
Frequency range [MHz]	853 – 883
Wavelength	$\lambda /2$
VSWR	≤ 2.0
Impedance [Ω]	50
Connector	SMA (Male)
Dimensions (L x d) [mm]	142 x 10
Peak gain [dBi]	-2.3
Operating temp. [°C]	-30 – +80

18.3.4.3 2600130082 - Hyperion-II magnetic base antenna

Well suited for applications where the RF is lead through a metal wall that could serve as ground plane to the antenna.

Figure 8: Hyperion-II magnetic base antenna with 1.5 m antenna cable

The 2600130082 is an antenna in form of $\lambda/4$ and therefore needs a ground plane at the feeding point.

Specification	Value
Frequency range [MHz]	824 – 894
VSWR	≤ 2.0
Polarisation	Vertical
Impedance [Ω]	50 ± 5
Connector	SMA (Male)
Dimensions (L x d) [mm]	89.8 x 27
Weight [g]	50 ± 5
Operating temp. [°C]	-30 – +60

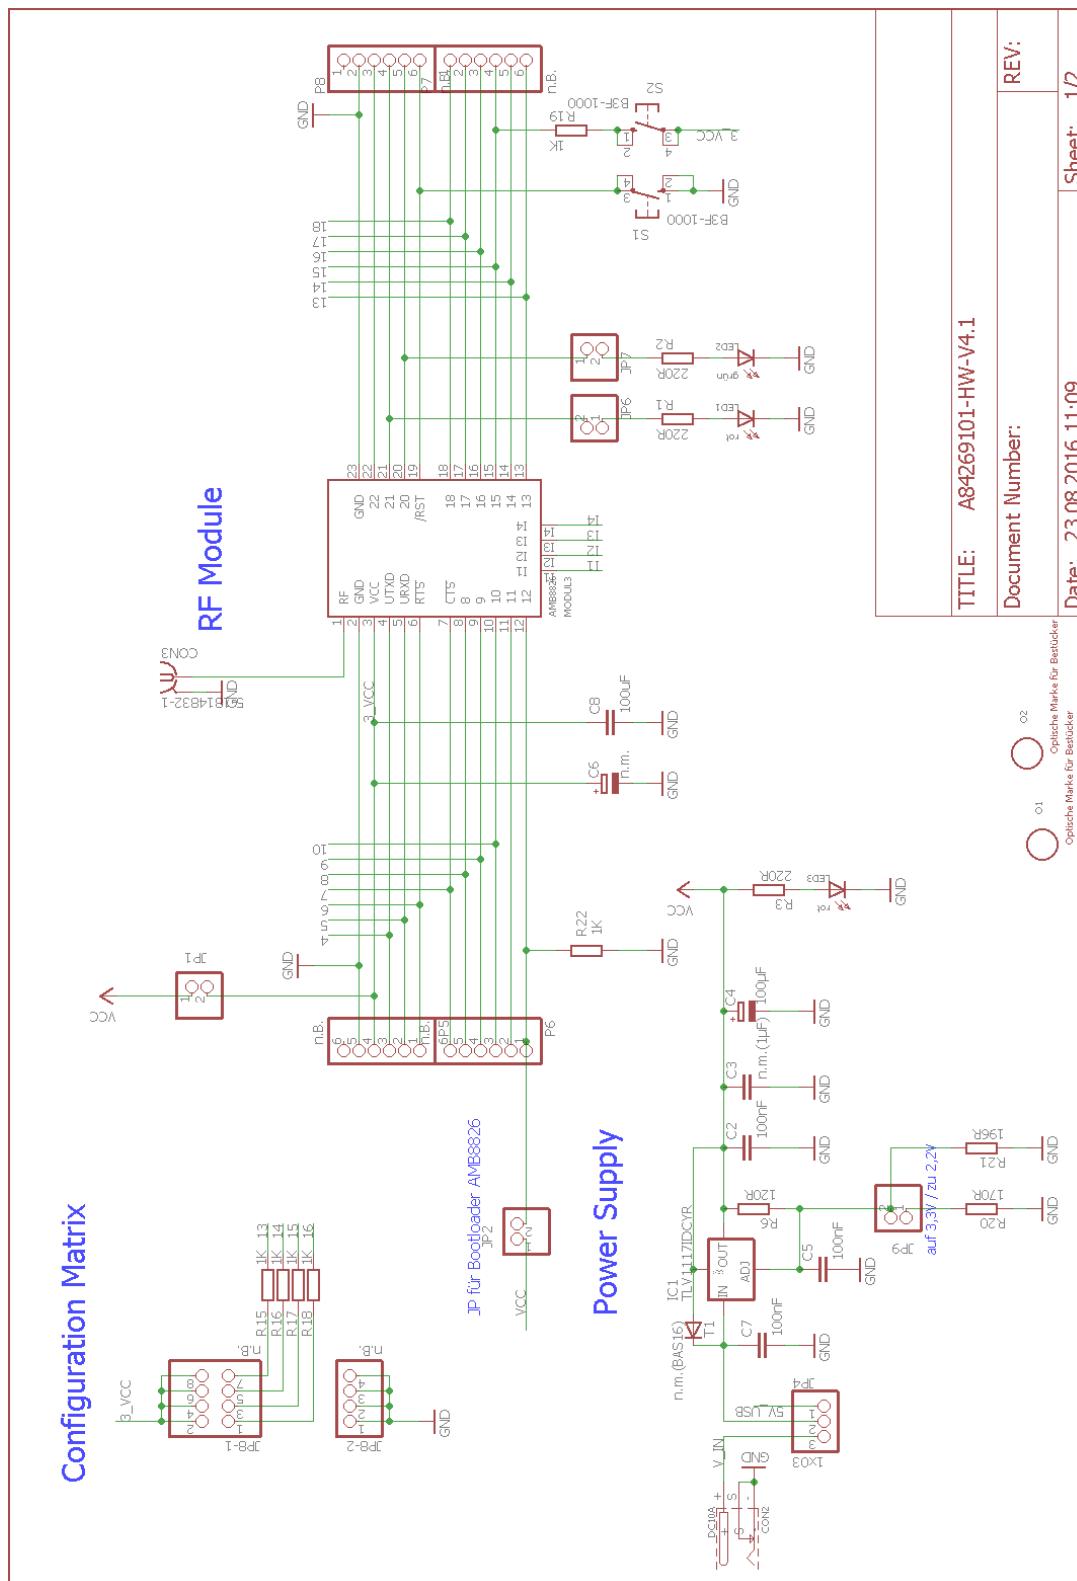

19 Reference design

Metis-II was tested and certified on the corresponding Metis-II EV-Board. For the compliance with the EU directive 2014/53/EU Annex I, the EV-Board serves as reference design.

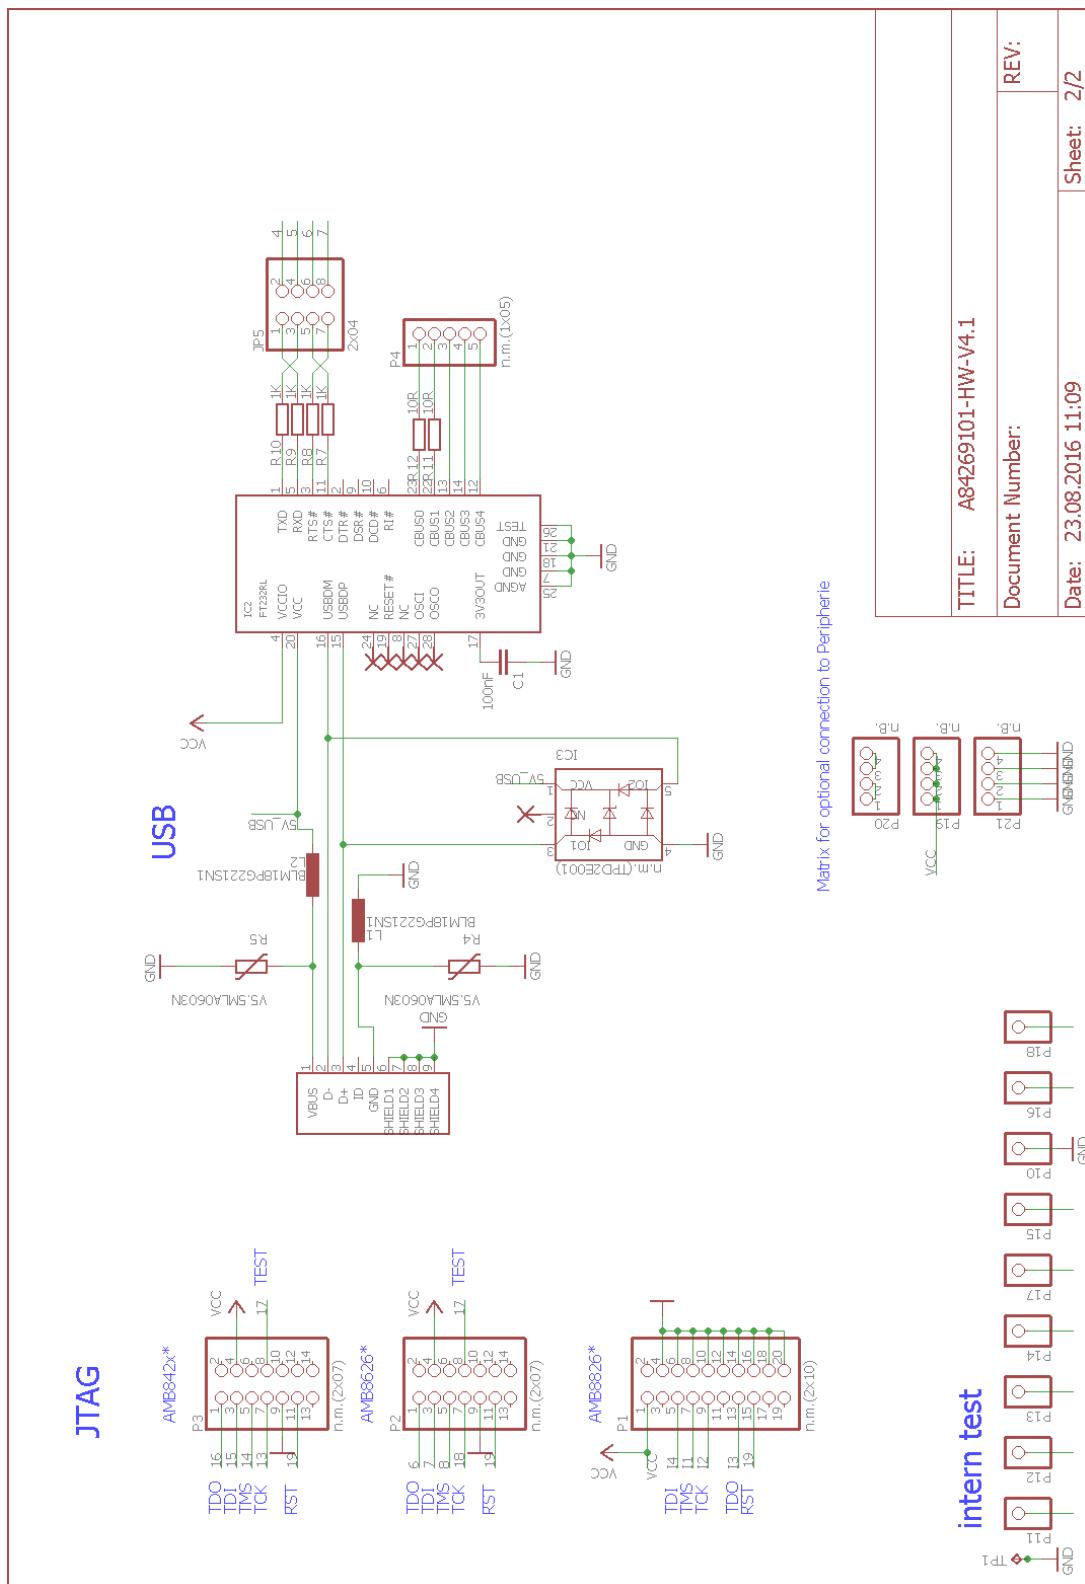

This is no discrepancy due to the fact that the EV-Board itself does not fall within the scope of the EU directive 2014/53/EU Annex I as the module is tested on the EV-Board, which is also the recommended use.

Further information concerning the use of the EV-Board can be found in the manual of the Metis-II EV-Board.

19.1 Schematic

User manual Metis-II Wireless M-BUS

19.2 Layout

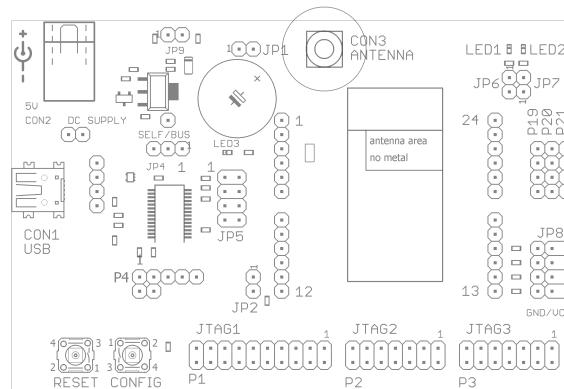

Figure 9: Assembly diagram

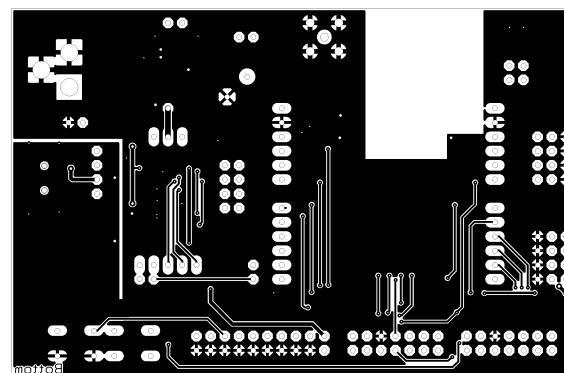

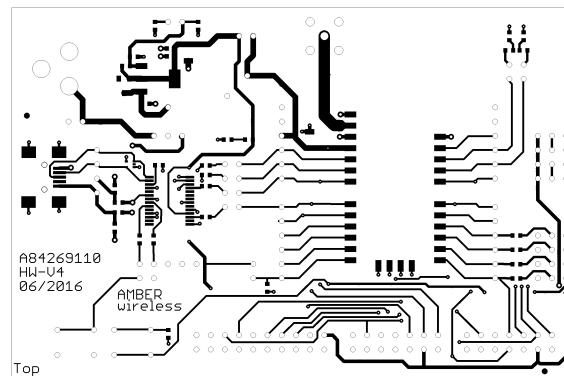

Figure 10: Top and Bottom Layer

20 Manufacturing information

20.1 Moisture sensitivity level

This wireless connectivity product is categorized as JEDEC Moisture Sensitivity Level 3 (MSL3), which requires special handling.

More information regarding the MSL requirements can be found in the IPC/JEDEC J-STD-020 standard on www.jedec.org.

More information about the handling, picking, shipping and the usage of moisture/reflow and/or process sensitive products can be found in the IPC/JEDEC J-STD-033 standard on www.jedec.org.

20.2 Soldering

20.2.1 Reflow soldering

Attention must be paid on the thickness of the solder resist between the host PCB top side and the modules bottom side. Only lead-free assembly is recommended according to JEDEC J-STD020.

Profile feature		Value
Preheat temperature, min	T_S Min	150 °C
Preheat temperature, max	T_S Max	200 °C
Preheat time from T_S Min to T_S Max	t_S	60 - 120 s
Ramp-up rate (T_L to T_P)		3 °C/s max.
Liquidous temperature	T_L	217 °C
Time t_L maintained above T_L	t_L	60 - 150 s
Peak package body temperature	T_P	245 °C
Time within 5 °C of actual peak temperature	t_P	20 - 30 s
Ramp-down rate (T_P to T_L)		6 °C/s max.
Time 20 °C to T_P		8 min max.

Table 28: Classification reflow soldering profile, Note: refer to IPC/JEDEC J-STD-020E

It is recommended to solder this module on the last reflow cycle of the PCB. For solder paste use a LFM-48W or Indium based SAC 305 alloy (Sn 96.5 / Ag 3.0 / Cu 0.5 / Indium 8.9HF / Type 3 / 89 %) type 3 or higher.

The reflow profile must be adjusted based on the thermal mass of the entire populated PCB, heat transfer efficiency of the reflow oven and the specific type of solder paste used. Based on the specific process and PCB layout the optimal soldering profile must be adjusted and verified. Other soldering methods (e.g. vapor phase) have not been verified and have to be validated by the customer at their own risk. Rework is not recommended.

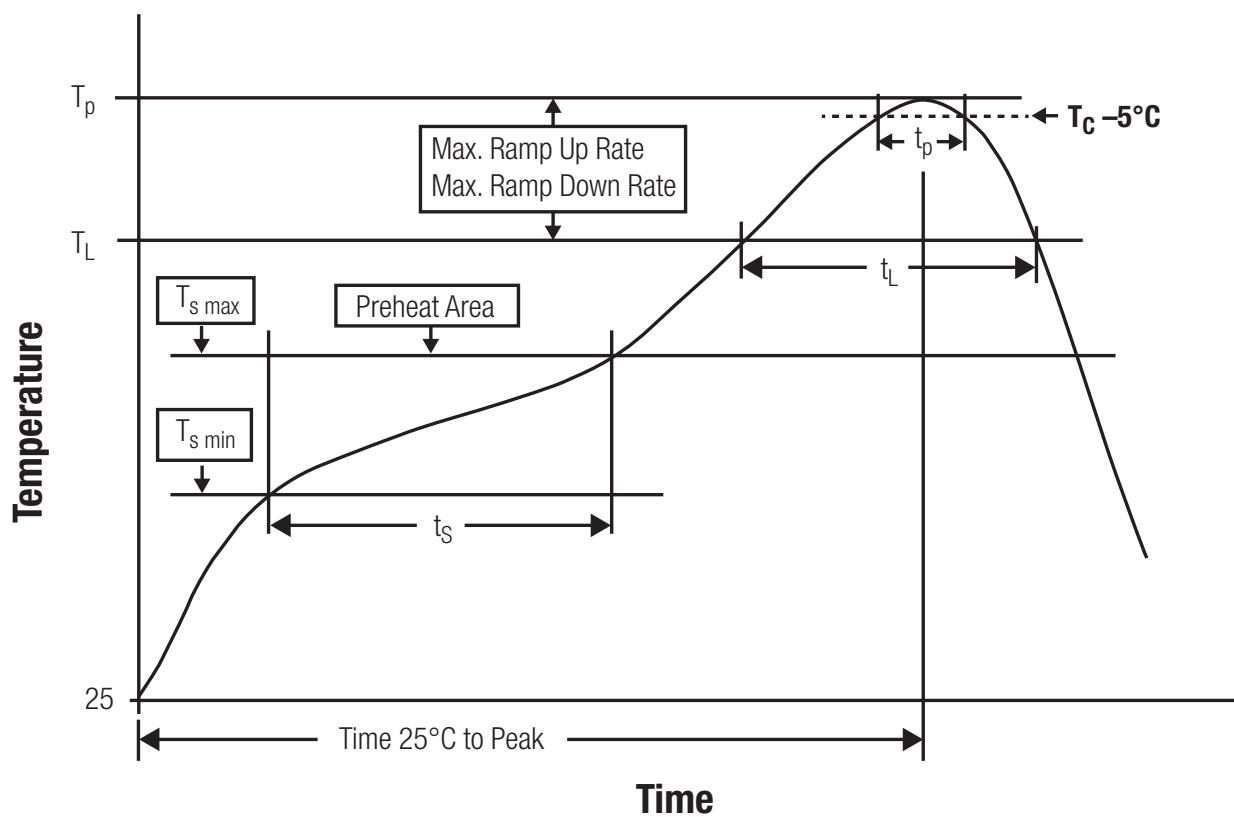

Figure 11: Reflow soldering profile

After reflow soldering, visually inspect the board to confirm proper alignment.

20.2.2 Cleaning

Do not clean the product. Any residue cannot be easily removed by washing. Use a "no clean" soldering paste and do not clean the board after soldering.

- Do not clean the product with water. Capillary effects can draw water into the gap between the host PCB and the module, absorbing water underneath it. If water is trapped inside, it may short-circuit adjoining pads. The water may also destroy the label and ink-jet printed text on it.
- Cleaning processes using alcohol or other organic solvents may draw solder flux residues into the housing, which won't be detected in a post-wash inspection. The solvent may also destroy the label and ink-jet printed text on it.
- Do not use ultrasonic cleaning as it will permanently damage the part, particularly the crystal oscillators.

20.2.3 Potting and coating

- If the product is potted in the customer application, the potting material might shrink or expand during and after hardening. Shrinking could lead to an incomplete seal, allowing contaminants into the component. Expansion could damage components. We recommend a manual inspection after potting to avoid these effects.
- Conformal coating or potting results in loss of warranty.
- The RF shield will not protect the part from low-viscosity coatings and potting. An undefined amount of coating and potting will enter inside the shielding.
- Conformal coating and potting will influence the parts of the radio front end and consequently influence the radio performance.
- Potting will influence the temperature behavior of the device. This might be critical for components with high power.

20.2.4 Other notations

- Do not attempt to improve the grounding by forming metal strips directly to the EMI covers or soldering on ground cables, as it may damage the part and will void the warranty.
- Always solder every pad to the host PCB even if some are unused, to improve the mechanical strength of the module.
- The part is sensitive to ultrasonic waves, as such do not use ultrasonic cleaning, welding or other processing. Any ultrasonic processing will void the warranty.

20.3 ESD handling

This product is highly sensitive to electrostatic discharge (ESD). As such, always use proper ESD precautions when handling. Make sure to handle the part properly throughout all stages of production, including on the host PCB where the module is installed. For ESD ratings, refer to the module series' maximum ESD section. For more information, refer to the relevant chapter 4. Failing to follow the aforementioned recommendations can result in severe damage to the part.

- The first contact point when handling the PCB is always between the local GND and the host PCB GND, unless there is a galvanic coupling between the local GND (for example work table) and the host PCB GND.
- Before assembling an antenna patch, connect the grounds.
- While handling the RF pin, avoid contact with any charged capacitors and be careful when contacting any materials that can develop charges (for example coaxial cable with around 50-80 pF/m, patch antenna with around 10 pF, soldering iron etc.)
- Do not touch any exposed area of the antenna to avoid electrostatic discharge. Do not let the antenna area be touched in a non ESD-safe manner.
- When soldering, use an ESD-safe soldering iron.

20.4 Safety recommendations

It is your duty to ensure that the product is allowed to be used in the destination country and within the required environment. Usage of the product can be dangerous and must be tested and verified by the end user. Be especially careful of:

- Use in areas with risk of explosion (for example oil refineries, gas stations).
- Use in areas such as airports, aircraft, hospitals, etc., where the product may interfere with other electronic components.

It is the customer's responsibility to ensure compliance with all applicable legal, regulatory and safety-related requirements as well as applicable environmental regulations. Disassembling the product is not allowed. Evidence of tampering will void the warranty.

- Compliance with the instructions in the product manual is recommended for correct product set-up.
- The product must be provided with a consolidated voltage source. The wiring must meet all applicable fire and security prevention standards.
- Handle with care. Avoid touching the pins as there could be ESD damage.

Be careful when working with any external components. When in doubt consult the technical documentation and relevant standards. Always use an antenna with the proper characteristics.

Würth Elektronik eiSos radio modules with high output power of up to 500 mW generate a large amount of heat while transmitting. The manufacturer of the end device must take care of potentially necessary actions for his application.

21 Product testing

21.1 Würth Elektronik eiSos in-house production tests

To achieve a high quality standard, Würth Elektronik eiSos follows a philosophy of supplying fully tested radio modules. At the end of the production process, every unit undergoes an optical inspection. Here the quality of soldering, edge castellation and edge milling is monitored.

If this has been passed, the radio modules are handed over to the automatic test equipment for the electrical characterization. This includes:

- Voltage and current tests to ensure proper electrical performance
- RF characteristics (frequency, spectrum, TX power) measurement and calibration
- Radio communication tests
- Firmware and serial number programming
- Host interface communication tests

The automated testing process is logged for internal quality control. The gained measurement data of each unit is analysed to detect defective parts and investigate the corresponding root cause. Defective radio modules are discarded, in order to guarantee a 100% failure-free delivery to customers.

21.2 EMS production tests

The rigorous in-series production testing ensures that EMS don't need to duplicate firmware tests or measurements. This streamlines the process and eliminates the need for additional testing over analogue and digital interfaces during device production. When it comes to device testing, the ideal focus should be on module assembly quality:

- All module pins are soldered properly on the base PCB
- There are no short circuits
- The mounting process did not damage the module
- The communication between host and radio module is working
- The antenna is connected properly

Simple "Go/No go" tests, like checking the RSSI value, give already a hint if the power supply and antenna have been connected properly.

In addition to such standard testing procedures, radio module integrators have the flexibility to perform additional dedicated tests to thoroughly evaluate the device. Specific tests they can consider are:

- Measure module current consumption in a specified operating state. Deviations from expected results (compared to a "Golden Device") can signal potential issues.

- Perform functional tests, including communication checks with the host controller and verification of interfaces.
- Assess fundamental RF characteristics (modulation accuracy, power levels, spectrum). Verify that the device meets expected performance standards.

22 Physical specifications

22.1 Dimensions

Dimensions
17 x 27 x 4 mm

Table 29: Dimensions

22.2 Weight

Weight
3 g

Table 30: Weight

22.3 Module drawing

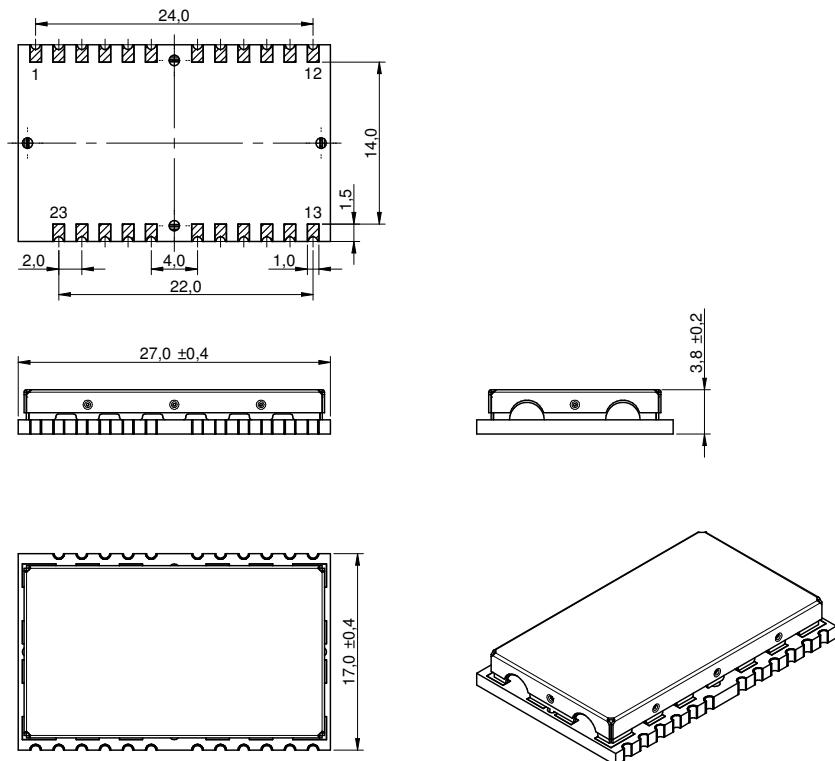

Figure 12: Module dimensions [mm]

22.4 Footprint

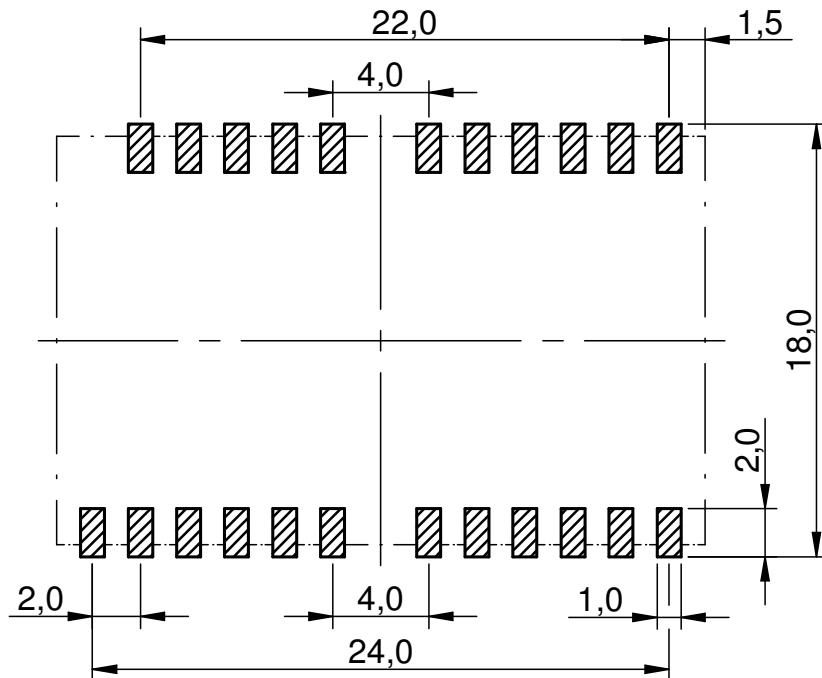

Figure 13: Footprint and dimensions [mm]

The following points have to be considered:

- To avoid the risk of short circuits, a minimum clearance of at least 14 mm between the opposing pad rows has to be maintained!
- No routing on the top layer of a carrier PCB (i.e. "under" the module) shall be performed.
- The carrier PCB shall place no vias "under" the module to prevent shortcuts
- This footprint is also compatible to AMB8626, AMB8426, AMB4426 and AMB3626 hardware platforms.

22.5 Antenna free area

To avoid influence and mismatching of the antenna the recommended free area around the antenna should be maintained. As rule of thumb a minimum distance of metal parts to the antenna of $\lambda/10$ should be kept (see figure 13). Even though metal parts would influence the characteristic of the antenna, but the direct influence and matching keep an acceptable level.

23 Marking

23.1 Lot number

The 15 digit lot number is printed in numerical digits as well as in form of a machine readable bar code. It is divided into 5 blocks as shown in the following picture and can be translated according to the following table.

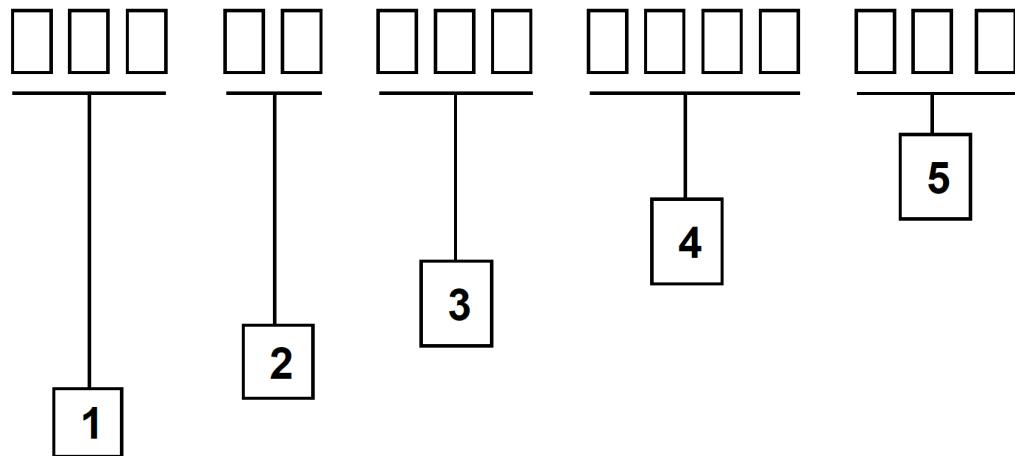

Figure 14: Lot number structure

Block	Information	Example(s)
1	eiSos internal, 3 digits	438
2	eiSos internal, 2 digits	01
3	Radio module hardware version, 3 digits	V2.4 = 024, V12.2 = 122
4	Date code, 4 digits	1703 = week 03 in year 2017, 1816 = week 16 in year 2018
5	Radio module firmware version, 3 digits	V3.2 = 302, V5.13 = 513

Table 31: Lot number details

As the user can perform a firmware update the printed lot number only shows the factory delivery state. The currently installed firmware can be requested from the module using the corresponding product specific command. The firmware version as well as the hardware version are restricted to show only major and minor version not the patch identifier. Block 5 is not applicable for products without firmware.

23.2 General labeling information

Labels of Würth Elektronik eiSos radio modules include several fields. Besides the manufacturer identification, the product's *WE* order code, serial number and certification information are placed on the label. In case of small labels, additional certification marks are placed on the label of the reel.

The information on the label are fixed. Only the serial number changes with each entity of the radio module. For Metis-II the label is as follows:

Figure 15: Label of the Metis-II

24 Regulatory compliance information

24.1 Important notice EU

The use of RF frequencies is limited by national regulations. The Metis-II has been designed to comply with the RED directive 2014/53/EU of the European Union (EU).

The Metis-II can be operated without notification and free of charge in the area of the European Union. However, according to the RED directive, restrictions (e.g. in terms of duty cycle or maximum allowed RF power) may apply.

Modifications (2014/53/EU article 3 (i))

Caution: Changes or modifications for this equipment not expressly approved by Würth Elektronik eiSos may void the CE conformity to operate this equipment.

24.2 Conformity assessment of the final product

The Metis-II is a subassembly. It is designed to be embedded into other products (products incorporating the Metis-II are henceforward referred to as "final products").

It is the responsibility of the manufacturer of the final product to ensure that the final product is in compliance with the essential requirements of the underlying national radio regulations.

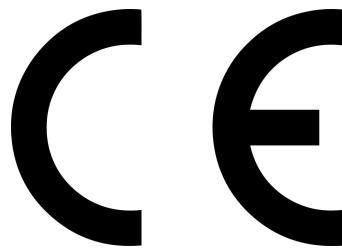

The conformity assessment of the subassembly Metis-II carried out by Würth Elektronik eiSos does not replace the required conformity assessment of the final product.

24.3 Exemption clause

Relevant regulation requirements are subject to change. Würth Elektronik eiSos does not guarantee the accuracy of the before mentioned information. Directives, technical standards, procedural descriptions and the like may be interpreted differently by the national authorities. Equally, the national laws and restrictions may vary with the country. In case of doubt or uncertainty, we recommend that you consult with the authorities or official certification organizations of the relevant countries. Würth Elektronik eiSos is exempt from any responsibilities or liabilities related to regulatory compliance.

Notwithstanding the above, Würth Elektronik eiSos makes no representations and warranties of any kind related to their accuracy, correctness, completeness and/or usability for customer applications. No responsibility is assumed for inaccuracies or incompleteness.

24.4 EU Declaration of conformity

EU DECLARATION OF CONFORMITY

Radio equipment: 2607021183000 & 2607056283000 &
2607021183010

The manufacturer: Würth Elektronik eiSos GmbH & Co. KG
Max-Eyth-Straße 1
74638 Waldenburg

This declaration of conformity is issued under the sole responsibility of the manufacturer.

Object of the declaration: 2607021183000 & 2607056283000 & 2607021183010

The object of the declaration described above is in conformity with the relevant Union harmonisation legislation: Directive 2014/53/EU and 2011/65/EU.

Following harmonised norms or technical specifications have been applied:

EN 300 220-1 V3.1.1 (2017-02)
EN 300 220-2 V3.1.1 (2017-02)
EN 301 489-1 V2.2.0 (Draft)
EN 301 489-3 V2.1.1 (Final draft)
EN 62479 : 2010
EN 62368-1:2014 + AC:2015

i.A. G. Eschenbrey

Trier, 18th of February 2019

Place and date of issue

24.5 RED-DA Cybersecurity statement

Cybersecurity as per articles 3.3d, 3.3e and 3.3f of the Radio Equipment Directive Delegated Act. The RED-DA mandates to comply to the EN 18031-1, 18031-2 and 18031-3 in order to fulfill the requirements of the cybersecurity chapters (d, e and f).

- EN 18031-1: Common security requirements for radio equipment - Part 1: Internet connected radio equipment
- EN 18031-2: Common security requirements for radio equipment - Part 2: Radio equipment processing data, namely internet connected radio equipment, childcare radio equipment, toys radio equipment and wearable radio equipment
- EN 18031-3: Common security requirements for radio equipment - Part 3: Internet connected radio equipment processing virtual money or monetary value

Requirements	Statement and conditions
(d) Radio equipment does not harm the network or its functioning nor misuses network resources, thereby causing an unacceptable degradation of service	<p>"Not applicable": The product is not capable itself to communicate over the internet. The product is only able to communicate via the following protocols and interfaces. None of the protocols contained in the product are "internet-connectable".</p> <p>Radio communication protocols: EN13757-4 and EN13757-3 is a european standard that is used for smart meter reading applications. The product supports the role "meter" as well as the role "other" to send and receive data in a standard compliant way with wireless M-BUS devices of the complementary role on the wireless link.</p> <p>Host Interface, wired: The host interface of the product does not support internet connectivity. UART is used as a wired communication and control channel towards the customers host.</p>
(e) Radio equipment incorporates safeguards to ensure that the personal data and privacy of the user and of the subscriber are protected	<p>"Not applicable": The product is not internet connected. The product does not pose a risk to the users or subscribers privacy, as it does not store or process any personal data.</p>

(f) Radio equipment supports certain features ensuring protection from fraud	"Not applicable": The product is not internet connected. The product does not pose a risk of fraud because it does not store or process financial data or enables financial transactions.
--	---

24.6 Important notice UKCA

The UK's government has laid legislation to continue recognition of current EU requirements for a range of product regulations, including the CE marking. The Radio Equipment Regulation 2017/1206 is within the scope of this announcement, among others.

Consequently, the Metis-II can be sold and utilized in the UK with the CE marking, without the need of UKCA declaration of conformity or UKCA marking.

25 Important notes

The following conditions apply to all goods within the wireless connectivity and sensors product range of Würth Elektronik eiSos GmbH & Co. KG:

General customer responsibility

Some goods within the product range of Würth Elektronik eiSos GmbH & Co. KG contain statements regarding general suitability for certain application areas. These statements about suitability are based on our knowledge and experience of typical requirements concerning the areas, serve as general guidance and cannot be estimated as binding statements about the suitability for a customer application. The responsibility for the applicability and use in a particular customer design is always solely within the authority of the customer. Due to this fact, it is up to the customer to evaluate, where appropriate to investigate and to decide whether the device with the specific product characteristics described in the product specification is valid and suitable for the respective customer application or not. Accordingly, the customer is cautioned to verify that the documentation is current before placing orders.

Customer responsibility related to specific, in particular safety-relevant applications

It has to be clearly pointed out that the possibility of a malfunction of electronic components or failure before the end of the usual lifetime cannot be completely eliminated in the current state of the art, even if the products are operated within the range of the specifications. The same statement is valid for all software source code and firmware parts contained in or used with or for products in the wireless connectivity and sensor product range of Würth Elektronik eiSos GmbH & Co. KG. In certain customer applications requiring a high level of safety and especially in customer applications in which the malfunction or failure of an electronic component could endanger human life or health, it must be ensured by most advanced technological aid of suitable design of the customer application that no injury or damage is caused to third parties in the event of malfunction or failure of an electronic component.

Best care and attention

Any product-specific data sheets, manuals, application notes, PCNs, warnings and cautions must be strictly observed in the most recent versions and matching to the products revisions. These documents can be downloaded from the product specific sections on the wireless connectivity and sensors homepage.

Customer support for product specifications

Some products within the product range may contain substances, which are subject to restrictions in certain jurisdictions in order to serve specific technical requirements. Necessary information is available on request. In this case, the Business Development Engineer (BDM) or the internal sales person in charge should be contacted who will be happy to support in this matter.

Product improvements

Due to constant product improvement, product specifications may change from time to time. As a standard reporting procedure of the Product Change Notification (PCN) according to the JEDEC-Standard, we inform about major changes. In case of further queries regarding the PCN, the Business Development Engineer (BDM), the internal sales person or the technical support team in charge should be contacted. The basic responsibility of the customer as per section 25 and 25 remains unaffected.

All software like "wireless connectivity SDK", "Sensor SDK" or other source codes as well as all PC software tools are not subject to the Product Change Notification information process.

Product life cycle

Due to technical progress and economical evaluation, we also reserve the right to discontinue production and delivery of products. As a standard reporting procedure of the Product Termination Notification (PTN) according to the JEDEC-Standard we will inform at an early stage about inevitable product discontinuance. According to this, we cannot ensure that all products within our product range will always be available. Therefore, it needs to be verified with the Business Development Engineer (BDM) or the internal sales person in charge about the current product availability expectancy before or when the product for application design-in disposal is considered. The approach named above does not apply in the case of individual agreements deviating from the foregoing for customer-specific products.

Property rights

All the rights for contractual products produced by Würth Elektronik eiSos GmbH & Co. KG on the basis of ideas, development contracts as well as models or templates that are subject to copyright, patent or commercial protection supplied to the customer will remain with Würth Elektronik eiSos GmbH & Co. KG. Würth Elektronik eiSos GmbH & Co. KG does not warrant or represent that any license, either expressed or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, application, or process in which Würth Elektronik eiSos GmbH & Co. KG components or services are used.

General terms and conditions

Unless otherwise agreed in individual contracts, all orders are subject to the current version of the "General Terms and Conditions of Würth Elektronik eiSos Group", last version available at www.we-online.com.

26 Legal notice

Exclusion of liability

Würth Elektronik eiSos GmbH & Co. KG considers the information in this document to be correct at the time of publication. However, Würth Elektronik eiSos GmbH & Co. KG reserves the right to modify the information such as technical specifications or functions of its products or discontinue the production of these products or the support of one of these products without any written announcement or notification to customers. The customer must make sure that the information used corresponds to the latest published information. Würth Elektronik eiSos GmbH & Co. KG does not assume any liability for the use of its products. Würth Elektronik eiSos GmbH & Co. KG does not grant licenses for its patent rights or for any other of its intellectual property rights or third-party rights.

Notwithstanding anything above, Würth Elektronik eiSos GmbH & Co. KG makes no representations and/or warranties of any kind for the

provided information related to their accuracy, correctness, completeness, usage of the products and/or usability for customer applications. Information published by Würth Elektronik eiSos GmbH & Co. KG regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof.

Suitability in customer applications

The customer bears the responsibility for compliance of systems or units, in which Würth Elektronik eiSos GmbH & Co. KG products are integrated, with applicable legal regulations. Customer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of Würth Elektronik eiSos GmbH & Co. KG components in its applications, notwithstanding any applications-related information or support that may be provided by Würth Elektronik eiSos GmbH & Co. KG. Customer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences lessen the likelihood of failures that might cause harm and take appropriate remedial actions. The customer will fully indemnify Würth Elektronik eiSos GmbH & Co. KG and its representatives against any damages arising out of the use of any Würth Elektronik eiSos GmbH & Co. KG components in safety-critical applications.

Trademarks

AMBER wireless is a registered trademark of Würth Elektronik eiSos GmbH & Co. KG. All other trademarks, registered trademarks, and product names are the exclusive property of the respective owners.

Usage restriction

Würth Elektronik eiSos GmbH & Co. KG products have been designed and developed for usage in general electronic equipment only. This product is not authorized for use in equipment where a higher safety standard and reliability standard is especially required or where a failure of the product is reasonably expected to cause severe personal injury or death, unless the parties have executed an agreement specifically governing such use. Moreover, Würth Elektronik eiSos GmbH & Co. KG products are neither designed nor intended for use in areas such as military, aerospace, aviation, nuclear control, submarine, transportation (automotive control, train control, ship control), transportation signal, disaster prevention, medical, public information network etc. Würth Elektronik eiSos GmbH & Co. KG must be informed about the intent of such usage before the design-in stage. In addition, sufficient reliability evaluation checks for safety must be performed on every electronic component, which is used in electrical circuits that require high safety and reliability function or performance. By using Würth Elektronik eiSos GmbH & Co. KG products, the customer agrees to these terms and conditions.

27 License terms

These License terms will take effect upon the purchase and usage of the Würth Elektronik eiSos GmbH & Co. KG wireless connectivity products. You hereby agree that these license terms are applicable to the product and the incorporated software, firmware and source codes (collectively, "Software") made available by Würth Elektronik eiSos in any form, including but not limited to binary, executable or source code form. The software included in any Würth Elektronik eiSos wireless connectivity product is purchased to you on the condition that you accept the terms and conditions of these license terms. You agree to comply with all provisions under these license terms.

Limited license

Würth Elektronik eiSos hereby grants you a limited, non-exclusive, non-transferable and royalty-free license to use the software and under the conditions that will be set forth in these license terms. You are free to use the provided software only in connection with one of the products from Würth Elektronik eiSos to the extent described in these license terms. You are entitled to change or alter the source code for the sole purpose of creating an application embedding the Würth Elektronik eiSos wireless connectivity product. The transfer of the source code to third parties is allowed to the sole extent that the source code is used by such third parties in connection with our product or another hardware provided by Würth Elektronik eiSos under strict adherence of these license terms. Würth Elektronik eiSos will not assume any liability for the usage of the incorporated software and the source code. You are not entitled to transfer the source code in any form to third parties without prior written consent of Würth Elektronik eiSos.

You are not allowed to reproduce, translate, reverse engineer, decompile, disassemble or create derivative works of the incorporated software and the source code in whole or in part. No more extensive rights to use and exploit the products are granted to you.

Usage and obligations

The responsibility for the applicability and use of the Würth Elektronik eiSos wireless connectivity product with the incorporated firmware in a particular customer design is always solely within the authority of the customer. Due to this fact, it is up to you to evaluate and investigate, where appropriate, and to decide whether the device with the specific product characteristics described in the product specification is valid and suitable for your respective application or not.

You are responsible for using the Würth Elektronik eiSos wireless connectivity product with the incorporated firmware in compliance with all applicable product liability and product safety laws. You acknowledge to minimize the risk of loss and harm to individuals and bear the risk for failure leading to personal injury or death due to your usage of the product.

Würth Elektronik eiSos' products with the incorporated firmware are not authorized for use in safety-critical applications, or where a failure of the product is reasonably expected to cause severe personal injury or death. Moreover, Würth Elektronik eiSos' products with the incorporated firmware are neither designed nor intended for use in areas such as military, aerospace, aviation, nuclear control, submarine, transportation (automotive control, train control, ship control), transportation signal, disaster prevention, medical, public information network etc. You shall inform Würth Elektronik eiSos about the intent of such usage before design-in stage. In certain customer applications requiring a very high level of safety and in which the malfunction or failure of an electronic component could endanger human life or health, you must ensure to have all necessary expertise in the safety and regulatory ramifications of your applications. You acknowledge and agree that you are solely responsible for all legal, regulatory and safety-related requirements concerning your products and any use of Würth Elektronik eiSos' products with the incorporated firmware in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by Würth Elektronik eiSos. YOU SHALL INDEMNIFY WÜRTH ELEKTRONIK EISOS AGAINST ANY DAMAGES ARISING OUT OF THE USE OF WÜRTH ELEKTRONIK EISOS' PRODUCTS WITH THE INCORPORATED FIRMWARE IN SUCH SAFETY-CRITICAL APPLICATIONS.

Ownership

The incorporated firmware created by Würth Elektronik eiSos is and will remain the exclusive property of Würth Elektronik eiSos.

Firmware update(s)

You have the opportunity to request the current and actual firmware for a bought wireless connectivity product within the time of warranty. However, Würth Elektronik eiSos has no obligation to update a modules firmware in their production facilities, but can offer this as a service on request. The upload of firmware updates falls within your responsibility, e.g. via ACC or another software for firmware updates. Firmware updates will not be communicated automatically. It is within your responsibility to check the current version of a firmware in the latest version of the product manual on our website. The revision table in the product manual provides all necessary information about firmware updates. There is no right to be provided with binary files, so called "firmware images", those could be flashed through JTAG, SWD, Spi-Bi-Wire, SPI or similar interfaces.

Disclaimer of warranty

THE FIRMWARE IS PROVIDED "AS IS". YOU ACKNOWLEDGE THAT WÜRTH ELEKTRONIK EISOS MAKES NO REPRESENTATIONS AND WARRANTIES OF ANY KIND RELATED TO, BUT NOT LIMITED TO THE NON-INFRINGEMENT OF THIRD PARTIES' INTELLECTUAL PROPERTY RIGHTS OR THE MERCHANTABILITY OR FITNESS FOR YOUR INTENDED PURPOSE OR USAGE. WÜRTH ELEKTRONIK EISOS DOES NOT WARRANT OR REPRESENT THAT ANY LICENSE, EITHER EXPRESS OR IMPLIED, IS GRANTED UNDER ANY PATENT RIGHT, COPYRIGHT, MASK WORK RIGHT, OR OTHER INTELLECTUAL PROPERTY RIGHT RELATING TO ANY COMBINATION, MACHINE, OR PROCESS IN WHICH THE WÜRTH ELEKTRONIK EISOS' PRODUCT WITH THE INCORPORATED FIRMWARE IS USED. INFORMATION PUBLISHED BY WÜRTH ELEKTRONIK EISOS REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE A LICENSE FROM WÜRTH ELEKTRONIK EISOS TO USE SUCH PRODUCTS OR SERVICES OR A WARRANTY OR ENDORSEMENT THEREOF.

Limitation of liability

Any liability not expressly provided by Würth Elektronik eiSos shall be disclaimed.

You agree to hold us harmless from any third-party claims related to your usage of the Würth Elektronik eiSos' products with the incorporated firmware, software and source code. Würth Elektronik eiSos disclaims any liability for any alteration, development created by you or your customers as well as for any combination with other products.

Applicable law and jurisdiction

Applicable law to these license terms shall be the laws of the Federal Republic of Germany. Any dispute, claim or controversy arising out of or relating to these license terms shall be resolved and finally settled by the court competent for the location of Würth Elektronik eiSos registered office.

Severability clause

If a provision of these license terms is or becomes invalid, unenforceable or null and void, this shall not affect the remaining provisions of the terms. The parties shall replace any such provisions with new valid provisions that most closely approximate the purpose of the terms.

Miscellaneous

Würth Elektronik eiSos reserves the right at any time to change these terms at its own discretion. It is your responsibility to check at Würth Elektronik eiSos homepage for any updates. Your continued usage of the products will be deemed as the acceptance of the change. We recommend you to be updated about the status of new firmware and software, which is available on our website or in our data sheet and manual, and to implement new software in your device where appropriate.

By ordering a product, you accept these license terms in all terms.
